Microscopy and Analysis ,2000 Business Publication Advertising Source ,2003-11 **Sedimentology and Stratigraphy** Gary Nichols,2013-04-30 This fully revised and updated edition introduces the reader to sedimentology and stratigraphic principles and provides tools for the interpretation of sediments and sedimentary rocks The processes of formation transport and deposition of sediment are considered and then applied to develop conceptual models for the full range of sedimentary environments from deserts to deep seas and reefs to rivers Different approaches to using stratigraphic principles to date and correlate strata are also considered in order to provide a comprehensive introduction to all aspects of sedimentology and stratigraphy The text and figures are designed to be accessible to anyone completely new to the subject and all of the illustrative material is provided in an accompanying CD ROM High resolution versions of these images can also be downloaded from the companion website for this book at www.wiley.com/go/nicholssedimentology

Encoding Visual Features by Parallel Ganglion Cell Initiated Pathways in the Healthy, Diseased and Artificial Retina Béla

Völgyi, Garrett T. Kenyon, David W. Marshak, Botir Sagdullaev, 2019-10-16 Photons are sensed by retinal photoreceptors whose matrix like distribution underlies the transformation of illumination patterns of the visual scene into photoreceptor activity patterns in a visuotopic fashion Activity of neighboring photoreceptors then are compared by secondary bipolar cells to decipher information regarding luminosity and color contrast Bipolar cells achieve this by comparing signals received directly from their center receptive field with those come from spatially offset surrounding receptive field areas mediated by inhibitory sign inverting horizontal cells This information is ultimately sent to retinal ganglion cells the output neurons of the retina In addition to the excitatory bipolar cell inputs spatial and temporal features of ganglion cell activation are robustly modified by inner retinal amacrine cells through inhibitory chemical and or excitatory electrical synaptic inputs Ganglion cells sample various bipolar cell subtypes in their dendritic field and utilize collected inputs to generate a spike output code on luminosity contrast color contrast object motion background motion motion direction changes in background illumination in a subtype specific manner Ganglion cells in each subtype cover the retinal surface economically thus collective information across the population provide a feature pattern and through time a feature movie to the brain Some of these movies are utilized for image perception whereas others are sent to accessory visual brain centers to control eye movement pupil contraction or circadian entrainment A large body of information has been revealed in the past decade regarding this field however much of the details still remain unknown or even enigmatic including i the precise description of neural circuits that serve each ganglion cell subtype to generate a specific feature movie ii the estimation of the number of various ganglion cell subtypes that partake in image forming and non image forming signaling towards the brain iii the description of changes in the inputs morphology and signaling of retinal ganglion cells when the tissue is under stress or undergoes disease related degenerative processes iv the comparison of ganglion cell classes with those of the human retina and finally v the practical
