Modeling And Reasoning With Bayesian Networks:

Modeling and Reasoning with Bayesian Networks Adnan Darwiche, 2009-04-06 This book is a thorough introduction to the formal foundations and practical applications of Bayesian networks. It provides an extensive discussion of techniques for building Bayesian networks that model real world situations including techniques for synthesizing models from design learning models from data and debugging models using sensitivity analysis. It also treats exact and approximate inference algorithms at both theoretical and practical levels. The treatment of exact algorithms covers the main inference paradigms based on elimination and conditioning and includes advanced methods for compiling Bayesian networks, time space tradeoffs and exploiting local structure of massively connected networks. The treatment of approximate algorithms covers the main inference paradigms based on sampling and optimization and includes influential algorithms such as importance sampling, MCMC and belief propagation. The author assumes very little background on the covered subjects, supplying in depth discussions for theoretically inclined readers and enough practical details to provide an algorithmic cookbook for the system developer.

Risk Assessment and Decision Analysis with Bayesian Networks Norman Fenton, Martin Neil, 2012-11-07 Although many Bayesian Network (BN) applications are now in everyday use, BNs have not yet achieved mainstream penetration. Focusing on practical real world problem solving and model building as opposed to algorithms and theory, *Risk Assessment and Decision Analysis with Bayesian Networks* explains how to incorporate knowledge with data to develop and use Bayesian causal models of risk that provide powerful insights and better decision making. Provides all tools necessary to build and run realistic Bayesian network models. Supplies extensive example models based on real risk assessment problems in a wide range of application domains provided for example: finance, safety systems, reliability, law and more. Introduces all necessary mathematics: probability and statistics as needed. The book first establishes the basics of probability, risk and building and using BN models, then goes into the detailed applications. The underlying BN algorithms appear in appendices rather than the main text since there is no need to understand them to build and use BN models. Keeping the body of the text free of intimidating mathematics, the book provides pragmatic advice about model building to ensure models are built efficiently. A dedicated website www.BayesianRisk.com contains executable versions of all of the models described, exercises and worked solutions for all chapters, PowerPoint slides, numerous other resources and a free downloadable copy of the AgenaRisk software.

Modeling, Learning and Reasoning with Structured Bayesian Networks Yujia Shen, 2020 Probabilistic graphical models, e.g. Bayesian Networks, have been traditionally introduced to model and reason with uncertainty. A graph structure is crafted to capture knowledge of conditional independence relationships among random variables which can enhance the computational complexity of reasoning. To generate such a graph, one sometimes has to provide vast and detailed knowledge about how variables interact, which may not be readily available. In some cases, although a graph structure can be obtained from available knowledge, it can be too dense to be useful computationally. In this dissertation, we propose a new

type of probabilistic graphical models called a Structured Bayesian network SBN that requires less detailed knowledge about conditional independences The new model can also leverage other types of knowledge including logical constraints and conditional independencies that are not visible in the graph structure Using SBNs different types of knowledge act in harmony to facilitate reasoning and learning from a stochastic world We study SBNs across the dimensions of modeling inference and learning We also demonstrate some of their applications in the domain of traffic modeling

Probabilistic Reasoning in Multiagent Systems Yang Xiang, 2002-08-26 This 2002 book investigates the opportunities in building intelligent decision support systems offered by multi agent distributed probabilistic reasoning Probabilistic reasoning with graphical models also known as Bayesian networks or belief networks has become increasingly an active field of research and practice in artificial intelligence operations research and statistics The success of this technique in modeling intelligent decision support systems under the centralized and single agent paradigm has been striking Yang Xiang extends graphical dependence models to the distributed and multi agent paradigm He identifies the major technical challenges involved in such an endeavor and presents the results The framework developed in the book allows distributed representation of uncertain knowledge on a large and complex environment embedded in multiple cooperative agents and effective exact and distributed probabilistic inference
