

# Solutions Manual for Fundamentals of Open Channel Flow, 2e by Glenn Moglen (All Chapters)

## Chapter 1: Introductory Material - Solutions

1.1. What slope would lead to a 1% difference between depth in the vertical plane rather than depth measured perpendicular to the channel bottom? Compare this slope to the observation that a channel slope of  $S_0 = 0.01 \text{ m/m}$  is generally considered quite steep for open channel flow.

Solution:

If  $\theta$  is the angle between the horizontal plane and the plane of the channel then,

$$\theta = \cos\left(\frac{\pi}{1.01\pi}\right)$$

Thus,

$$\theta = 8.1^\circ$$

or, in terms of rise/run,

$$S = \tan(8.1^\circ) = 0.14 \text{ m/m}$$

Comparing this number to a channel slope of  $S_0=0.01 \text{ m/m}$  we see that the slope corresponding to a 1.0 percent difference between depths is more than an order of magnitude larger.

1.2. Using Bernoulli's equation, write the energy balance in general terms for flow in an open channel from location 1 to 2 where  $h_L$  is the head loss between these two locations. Simplify the equation by taking the perspective of a point on the water surface at both locations. Note: your solution should show that the pressure term from Bernoulli's equation is not relevant for open channel flow.

Solution:

$$\frac{P_1}{\gamma} + \frac{V_1^2}{2g} + z_1 = \frac{P_2}{\gamma} + \frac{V_2^2}{2g} + z_2 + h_L$$

If we take a point on the water surface at both locations, the  $p_1$  equals  $p_2$  equals atmospheric pressure, and thus these terms may be cancelled from both sides of the equality.

$$\frac{V_1^2}{2g} + z_1 = \frac{V_2^2}{2g} + z_2 + h_L$$

The remaining equation if  $y$  is substituted for  $z$  and if  $h_L$  is set to zero, forms the basis for the specific energy equation which is the focus for Chapter 2.
