Numerical Methods In Sensitivity Analysis And Shape Optimization:

Numerical Methods in Sensitivity Analysis and Shape Optimization Emmanuel Laporte, Patrick Le Tallec, 2012-12-06

Sensitivity analysis and optimal shape design are key issues in engineering that have been affected by advances in numerical tools currently available. This book and its supplementary online files presents basic optimization techniques that can be used to compute the sensitivity of a given design to local change or to improve its performance by local optimization of these data. The relevance and scope of these techniques have improved dramatically in recent years because of progress in discretization strategies, optimization algorithms, automatic differentiation, software availability and the power of personal computers. Numerical Methods in Sensitivity Analysis and Shape Optimization will be of interest to graduate students involved in mathematical modeling and simulation as well as engineers and researchers in applied mathematics looking for an up to date introduction to optimization techniques, sensitivity analysis and optimal design.

Introduction to Shape Optimization Jan Sokolowski, Jean-Paul Zolesio, 2012-12-06. This book is motivated largely by a desire to solve shape optimization problems that arise in applications, particularly in structural mechanics and in the optimal control of distributed parameter systems. Many such problems can be formulated as the minimization of functionals defined over a class of admissible domains. Shape optimization is quite indispensable in the design and construction of industrial structures. For example, aircraft and spacecraft have to satisfy at the same time very strict criteria on mechanical performance while weighing as little as possible. The shape optimization problem for such a structure consists in finding a geometry of the structure which minimizes a given functional, e.g. such as the weight of the structure and yet simultaneously satisfies specific constraints like thickness, strain energy or displacement bounds. The geometry of the structure can be considered as a given domain in the three dimensional Euclidean space. The domain is an open bounded set whose topology is given, e.g. it may be simply or doubly connected. The boundary is smooth or piecewise smooth so boundary value problems that are defined in the domain and associated with the classical partial differential equations of mathematical physics are well posed. In general, the cost functional takes the form of an integral over the domain or its boundary where the integrand depends smoothly on the solution of a boundary value problem.

Shape Design Sensitivity Analysis and Optimization Using the Boundary Element Method Zhiye Zhao, 2012-12-06. This book investigates the various aspects of shape optimization of two dimensional continuum structures including shape design, sensitivity analysis, structural analysis using the boundary element method (BEM) and shape optimization implementation. The book begins by reviewing the developments of shape optimization followed by the presentation of the mathematical programming methods for solving optimization problems. The basic theory of the BEM is presented which will be employed later on as the numerical tool to provide the structural responses and the shape design sensitivities. The key issue of shape optimization, the shape design sensitivity analysis, is fully investigated. A general formulation of stress sensitivity using the continuum approach is presented. The difficulty of the modelling of the ad

joint problem is studied and two approaches are presented for the modelling of the adjoint problem. The first approach uses distributed loads to smooth the concentrated adjoint loads and the second approach employs the singularity subtraction method to remove the singular boundary displacements and tractions from the BEM equation. A novel finite difference based approach to shape design sensitivity is presented which overcomes the two drawbacks of the conventional finite difference method. This approach has the advantage of being simple in concept and easier implementation. A shape optimization program for two dimensional continuum structures is developed including structural analysis using the BEM shape design sensitivity analysis mathematical programming and the design boundary modelling.

Introduction to Shape Optimization J. Haslinger, R. A. E. Makinen, 2003-01-01. The efficiency and reliability of manufactured products depend on among other things geometrical aspects it is therefore not surprising that optimal shape design problems have attracted the interest of applied mathematicians and engineers. This self contained elementary introduction to the mathematical and computational aspects of sizing and shape optimization enables readers to gain a firm understanding of the theoretical and practical aspects so they may confidently enter this field. *Introduction to Shape Optimization Theory Approximation and Computation* treats sizing and shape optimization comprehensively covering everything from mathematical theory existence analysis discretizations and convergence analysis for discretized problems through computational aspects sensitivity analysis numerical minimization methods to industrial applications. Applications include contact stress minimization for elasto plastic bodies multidisciplinary optimization of an airfoil and shape optimization of a dividing tube. By presenting sizing and shape optimization in an abstract way the authors are able to use a unified approach in the mathematical analysis for a large class of optimization problems in various fields of physics. Audience the book is written primarily for students of applied mathematics scientific computing and mechanics. Most of the material is directed toward graduate students although a portion of it is suitable for senior undergraduate students. Readers are assumed to have some knowledge of partial differential equations and their numerical solution as well as modern programming language such as C Fortran 90.

Applied Mechanics Reviews, 1991. *Inverse Problems in Engineering Mechanics II* G.S. Dulikravich, Mana Tanaka, 2000-12-11. Inverse Problems are found in many areas of engineering mechanics and there are many successful applications e.g. in non destructive testing and characterization of material properties by ultrasonic or X ray techniques thermography etc. Generally speaking inverse problems are concerned with the determination of the input and the characteristics of a system given certain aspects of its output. Mathematically such problems are ill posed and have to be overcome through development of new computational schemes regularization techniques objective functionals and experimental procedures. Following the IUTAM Symposium on these topics held in May 1992 in Tokyo another in November 1994 in Paris and also the more recent ISIP 98 in March 1998 in Nagano it was concluded that it would be fruitful to gather regularly with researchers and engineers for an exchange of the newest research ideas. The most recent Symposium of this series International Symposium on Inverse Problems in Engineering

Mechanics ISIP2000 was held in March of 2000 in Nagano Japan where recent developments in inverse problems in engineering mechanics and related topics were discussed. The following general areas in inverse problems in engineering mechanics were the subjects of ISIP2000: mathematical and computational aspects of inverse problems, parameter or system identification, shape determination, sensitivity analysis, optimization, material property characterization, ultrasonic non-destructive testing, elastodynamic inverse problems, thermal inverse problems and other engineering applications. The papers in these proceedings provide a state of the art review of the research on inverse problems in engineering mechanics and it is hoped that some breakthrough in the research can be made and that technology transfer will be stimulated and accelerated due to their publication.

Sensitivity analysis and shape optimization of geometrically non-linear structures, 2000. Este trabalho propõe uma metodologia para a otimização de forma de estruturas geometricamente não lineares. O objetivo desta metodologia é evitar os problemas de instabilidade apresentados por estruturas otimizadas de acordo com a fórmula clássica. Ela foi implementada para problemas bidimensionais e os resultados obtidos na otimização de diferentes estruturas demonstraram o seu sucesso. Utilizando-se conceitos de modelagem geométrica a forma da estrutura é definida através das curvas de seu contorno. Assim a representação paramétrica de curvas é definida nestas em função de um conjunto de pontos de interpolação e pontos-chave são discutidas detalhadamente. A análise é dada através de B-splines devido à sua grande flexibilidade. O problema de otimização definido com base no modelo geométrico e as variáveis de projeto são as coordenadas dos pontos-chave. A simetria da estrutura é garantida através da ligação de variáveis. A estrutura analisada através de elementos isoparamétricos planos. Assim, antes de realizar a análise, é necessário discretizar a estrutura em um conjunto de elementos finitos. Para realizar esta tarefa foram implementados diferentes algoritmos de geração de malhas tanto estruturadas quanto não estruturadas. O método de Newton-Raphson utilizado para determinar a configuração de equilíbrio e diferentes métodos podem ser aplicados para determinar os pontos críticos. Devido aos problemas de convergência apresentados pelos métodos diretos para a determinação dos pontos críticos, um método semi-direto foi desenvolvido neste trabalho. Os resultados obtidos na análise de diferentes exemplos mostraram a adequação dos elementos finitos e dos métodos

Design Sensitivity Analysis and Optimization of Electromagnetic Systems II Han Park, 2018-08-27 This book presents a comprehensive introduction to design sensitivity analysis theory as applied to electromagnetic systems It treats the subject in a unified manner providing numerical methods and design examples The specific focus is on continuum design sensitivity analysis which offers significant advantages over discrete design sensitivity methods Continuum design sensitivity formulas are derived from the material derivative in continuum mechanics and the variational form of the governing equation Continuum sensitivity analysis is applied to Maxwell

equations of electrostatic magnetostatic and eddy current systems and then the sensitivity formulas for each system are derived in a closed form an integration along the design interface The book also introduces the recent breakthrough of the topology optimization method which is accomplished by coupling the level set method and continuum design sensitivity This topology optimization method enhances the possibility of the global minimum with minimised computational time and in addition the evolving shapes during the iterative design process are easily captured in the level set equation Moreover since the optimization algorithm is transformed into a well known transient analysis algorithm for differential equations its numerical implementation becomes very simple and convenient Despite the complex derivation processes and mathematical expressions the obtained sensitivity formulas are very straightforward for numerical implementation This book provides detailed explanation of the background theory and the derivation process which will help readers understand the design method and will set the foundation for advanced research in the future
