Hernandez, G. Schleyer, 2022-09-13 The use of novel materials and new structural concepts nowadays is not restricted to highly technical areas like aerospace aeronautical applications or the automotive industry but affects all engineering fields including those such as civil engineering and architecture The included contributions highlight the latest developments in design and manufacturing Most high performance structures require the development of a generation of new materials which can more easily resist a range of external stimuli or react in a non conventional manner Particular emphasis is placed on intelligent structures and materials as well as the application of computational methods for their modelling control and management The book also addresses the topic of design optimisation Contributions cover numerical methods different optimisation techniques and new software Optimisation problems include those related to the size shape and topology of structures and materials Optimisation techniques have much to offer to those involved in the design of new industrial products as the appearance of powerful commercial computer codes has created a fertile field for the incorporation of optimisation in the design process of all engineering disciplines The performance of structures under shock and impact loads is another area covered The increasing need to protect civilian infrastructure and industrial facilities against unintentional loads arising from accidental impact and explosion events as well as terrorist attacks is reflected in the sustained interest worldwide While advances have been made in recent decades many challenges remain such as developing more effective and efficient blast and impact mitigation approaches or assessing the uncertainties associated with large and small scale testing and validation of numerical and analytical models The overall aim is to move towards a better understanding of the critical issues relating to the testing behaviour modelling and analyses of protective structures against blast and impact loading The studies contained in this volume were presented at the International Conference on High Performance and Optimum

Structures and Materials Encompassing Shock and Impact Loading and address issues involving advanced types of structures particularly those based on new concepts and shock and impact resistance High Performance and Optimum Design of Structures and Materials W. P. De Wilde, S. Hernández, C. A. Brebbia, 2014-06-09 The use of novel materials and new structural concepts nowadays is not restricted to highly technical areas like aerospace aeronautical applications or the automotive industry but affects all engineering fields including those such as civil engineering and architecture Addressing issues involving advanced types of structures particularly those based on new concepts or new materials and their system design contributions highlight the latest developments in design optimisation manufacturing and experimentation Also included are contributions on new software numerical methods and different optimisation techniques Optimisation problems of interest involve those related to size shape and topology of structures and materials Most high performance structures require the development of a generation of new materials which can more easily resist a range of external stimuli or react in a non conventional manner Particular emphasis is placed on intelligent structures and materials as well as the application of computational methods for their modelling control and management Optimisation techniques have much to offer to those involved in the design of new industrial products The formulation of optimum design has evolved from the time it was purely an academic topic able now to satisfy the requirements of real life prototypes The development of new algorithms and the appearance of powerful commercial computer codes with easy to use graphical interfaces have created a fertile field for the incorporation of optimisation in the design process in all engineering disciplines This proceedings volume is the first from a new edition of the High Performance Design of Structures and Materials and the Optimum Design of Structures conferences which follows the success of a number of meetings that originated in 1989 Topics covered include Composite materials Material characterisation Experiments and numerical analysis Steel structures High performance concretes Natural fibre composites Transformable structures Lightweight structures Timber structures Environmentally friendly and sustainable structures Emerging structural applications Optimisation in civil engineering Evolutionary methods in optimisation Shape and topology optimisation Aerospace structures Structural optimisation Biomechanics application Material optimisation Life cost optimisation Intelligence structures and smart materials High Performance and Optimum Design of Structures and Materials IV S. Hernández, W.P. De Wilde, M. Sejnoha, 2020-11-18 Most high performance structures require the development of a generation of new materials which can more easily resist a range of external stimuli or react in a non conventional manner Formed of research works presented at the 10th International Conference on High Performance and Optimum Design of Structures and Materials the included papers cover issues involving advanced types of structures particularly those based on new concepts or new materials and their system design Contributions highlight the latest developments in design optimisation manufacturing and experimentation There is also a focus on the search for higher performance sustainable materials Particular emphasis is placed on intelligent structures and materials as well as the application of computational

methods for their modelling control and management Optimisation problems are also covered including those related to the size shape and topology of structures and materials Optimisation techniques have much to offer to those involved in the design of new industrial products The development of new algorithms and the appearance of powerful commercial computer codes with easy to use graphical interfaces has created a fertile field for the incorporation of optimisation in the design process in all engineering disciplines

*Music-Inspired Harmony Search Algorithm* Zong Woo Geem,2009-05-12 Calculus has been used in solving many scientific and engineering problems For optimization problems however the differential calculus technique sometimes has a drawback when the objective function is step wise discontinuous or multi modal or when decision variables are discrete rather than continuous Thus researchers have recently turned their interests into metaheuristic algorithms that have been inspired by natural phenomena such as evolution animal behavior or metallic annealing This book especially focuses on a music inspired metaheuristic algorithm harmony search Interestingly there exists an analogy between music and optimization each musical instrument corresponds to each decision variable musical note corresponds to variable value and harmony corresponds to solution vector Just like musicians in Jazz improvisation play notes randomly or based on experiences in order to find fantastic harmony variables in the harmony search algorithm have random values or previously memorized good values in order to find optimal solution

*Meta-heuristic Algorithms for Optimal Design of Real-Size Structures* Ali Kaveh,Majid Ilchi Ghazaan,2018-04-10 The contributions in this book discuss large scale problems like the optimal design of domes antennas transmission line towers barrel vaults and steel frames with different types of limitations such as strength buckling displacement and natural frequencies The authors use a set of definite algorithms for the optimization of all types of structures They also add a new enhanced version of VPS and information about configuration processes to all chapters Domes are of special interest to engineers as they enclose a maximum amount of space with a minimum surface and have proven to be very economical in terms of consumption of constructional materials Antennas and transmission line towers are the one of the most popular structure since these steel lattice towers are inexpensive strong light and wind resistant Architects and engineers choose barrel vaults as viable and often highly suitable forms for covering not only low cost industrial buildings warehouses large span hangars indoor sports stadiums but also large cultural and leisure centers Steel buildings are preferred in residential as well as commercial buildings due to their high strength and ductility particularly in regions which are prone to earthquakes
