

Volume Study Guide

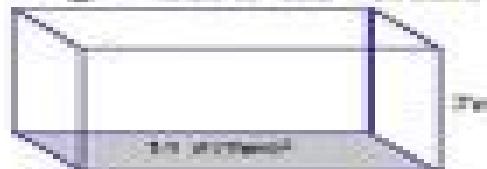

Volume is the amount of space that something takes up. We can find the volume of a cube or rectangular prism by calculating the length times width times height. There are 3 dimensions, which means we are looking at 3D figures. 3 dimensions means we put a little “³” as an exponent beside the multiplication. This is called “cubed” or “cube”. Below are examples of questions similar to the ones you may see on the test, and must be able to correctly calculate the answer.

- What is the volume of the rectangular prism below?

The answer is 24 cubic units. We multiply the length, which is 4, by the height, which is 2, by the width, which is 3. $4 \times 3 \times 2 = 24$ cubic units.

- What is the volume of this rectangular prism?

The correct answer is 84 cubic inches. We can see that the area of the base has already been found (the exponent “²” means area). We find area by multiplying length times width. Since volume is length times width times height, and they have already multiplied length times width for us (giving us 12 square inches), all we have to do is multiply 12 times 7 (our height) to find the volume.

More mathematical concepts are addressed at younger ages as a result of Common Core State Standards. In the 6th grade students do much more in depth work with geometry ratio and percentage as well as statistics and probability. This is not the first time these concepts are addressed though. The Common Core approach requires going deeper into content learned in earlier years. Because of this need to look at each grade instead of just one year a reference guide for parents and guardians would provide a much better snapshot showing the big picture mathematical goal for each student. *Resources in Education*, 1997. *Student Study Guide & Selected Solutions Manual* David D.
