

Kurs über numerische Methoden

Diese Kurse in numerischen Methoden richten sich sowohl an Studierende der Ingenieurwissenschaften als auch an Studierende des LMD Bachelor of Science and Technology. Die Methoden werden in einer einfach zu verstehenden und mit Beispielen untermauerten Art und Weise dargestellt, die es dem Studenten ermöglichen, sie anzuwenden. Diese Methoden umfassen die Probleme der Lösung nichtlinearer Gleichungen & und linearer Gleichungssysteme, numerische Integration, Interpolation und Approximation von Funktionen und schließlich die numerische Lösung von Differentialgleichungen erster Ordnung.

Braess, L.L. Schumaker, 2013-03-11 This book is the official proceedings of a conference on Numerical Methods in Approximation Theory which was held at the Mathematisches Forschungsinstitut in Oberwolfach during the week of November 24-30 1991 It contains refereed and edited papers by 20 of the 49 participants The book is dedicated to the memory of Prof Lothar Collatz who maintained a long and active interest in numerical approximation It is the ninth in a series of volumes published by Birkhäuser resulting from conferences on the subject held at Oberwolfach and co organized by Prof Collatz We now briefly describe the contents of the book The paper of BASZENSKI DELVOS and JESTER deals with blending using sine double series expansions of functions defined on the unit square In addition to giving explicit error estimates for partial sums and

for interpolating sine polynomials they also show that Boolean sums yield almost the same asymptotic error estimates as the conventional tensor product approach but with a reduced number of terms The paper of BEATSON and LIGHT discusses approximation by quasi interpolants which are sums of scaled translates of a one parameter family of functions They do not require reproduction of low degree polynomials but nevertheless are able to give error bounds and analyze quasi interpolation based on Gaussians and exponentials BINEV and JETTER deal with multivariate interpolation using shifts of a single basis function They treat both gridded data and scattered data As examples they consider box splines and certain radial basis functions

computational mechanics and in optimization of complicated technical models Also the volume contains papers discussing the historical development the state of the art new ideas and open problems arising in modern continuum mechanics and applied optimization problems Several papers are concerned with mathematical problems in numerical analysis which are also closely related to important mechanical models The main topics treated include Computer simulation methods in mechanics physics and biology Variational problems and methods minimization algorithms Optimal control problems with distributed and discrete control Shape optimization and shape design problems in science and engineering Sensitivity analysis and parameters optimization of complex systems General Inequalities 2 Edwin F.
