Multisector Growth Models Theory And Application:

Multisector Growth Models Terry L. Roe, Rodney B. W. Smith, D. Sirin Saracoglu, 2009-10-03 The primary objective of this book is to advance the state of the art in specifying and fitting to data structural multi sector dynamic macroeconomic models and empirically implementing them The fundamental construct upon which we build is the Ramsey model A most attractive feature of this model is the insights it provides into the dynamics of an economy in transition to long run equilibrium With some exceptions Ramsey models are highly aggregated typically single sector models However interest often lies in understanding the forces of economic growth across multiple sectors of an economy and on how policy impacts likely play out over time Such analyses call for more disaggregated models that can be fit to country or regional data This book shows how to i extend the basic model to multiple sectors ii how to adapt the basic model to account for policy instruments and iii fit the model to data and obtain equilibrium values both forward and backward in time from the data points to which the model is initially fit

Mathematical Economics and Mathematical Models of Economic Growth, 1981 **Embodied Technical Progress in a Multi-sectoral Economic Growth Model** Yasuo Murata, 1965 The effect of vintage of capital on a multi sectoral economic growth model is examined First the author extends the substitution theorem to a dynamic system where various capital goods are classified not only in terms of their kinds but also in terms of their vintages With no joint production each commodity is assumed to have a Cobb Douglas type of production function which

is identical for all different vintages of its capital goods In a steady state equilibrium capital output ratios in efficiency units when involving the capitalaugmenting technical progress turn out to be invariant for individual vintages It is also shown that all capital and labor output ratios in the economy take simple and easily calculated functions of only the interest rate and the trend values of technology Current flow requirements per output defined as depreciated part of capital goods vary over time along with the distribution of their vintages However in a steady state equilibrium they take invariant values in the case of no technological change Second the author is concerned with the existence of a unique balanced growth of production in our multi sectoral model which turns out to be a variant of the dynamic Leontief model Making use of the Hawkins Simon conditions and the Frobenius theorem we prove the existence of the balanced growth in abstraction from technological change as well as in the case of technical progress Author Documentation Abstracts ,1996 *The Theory of Quantitative Economic Policy with Applications to Economic Growth, Stabilization and Planning* Karl A.
