**Automated Cone Machine** Young-Chul Lee, Wilderich A. White, Stephen A. Velinsky, 2004 The Advanced Highway

Maintenance and Construction Technology AHMCT Research Center has been developing robotic equipment and machinery

for highway maintenance and construction operations. It is a cooperative venture between the University of California at

Davis and the California Department of Transportation Caltrans. The research and development projects have the goal of

increasing safety and efficiency of roadwork operations through the appropriate application of automation solutions. This

report describes the continuing development of automated equipment for deploying and retrieving traffic cones. In this latest

phase of the project the center has continued the development of the automated cone machine ACM through further testing

and development of the first generation integrated prototype ACM and the design and fabrication of an integrated Multi

stack ACM developed to maximize the number of cones carried by the automated cone machine. Included in this report is the

development of an improved control system for the retrieval arm which is a critical component used to pick up the traffic

cone off the road. A first generation ACM prototype ACM 1 is being used in tests and demonstrations on the highways of

California. Operators using ACM 1 can place and retrieve cones without any set up and control the machine from within the

confines of the cab. These machines can easily be run by a single operator and are very compatible with the process of closing

a lane. The ACM 1 design was integrated into the existing Caltrans manual cone body truck and was limited to two stacks of

40 cones each. The new ACM multistack is designed to carry six stacks of 50 cones for a total of 300 cones. These machines

are unambiguous demonstrations of the successful application of automation in a very demanding environment. This

development work and the continued support of commercialization at AHMCT support the Caltrans goal of making these

machines available to the maintenance operations    **Handbook of Thermoprocessing Technologies** Axel von Starck, Alfred

Mühlbauer, Carl Kramer, 2005 In Europe thermoprocessing is the third largest energy consumption sector following traffic

and room heating. Its structure is very much diversified and complex. Therefore it is split into a large number of subdivisions

each of them having a high importance for the industrial economy. Accordingly we find the application know how for the

design and the execution of respective equipment represented by a multitude of small but very specialized and significant companies and their experts As a result there was only little chance to find a comprehensive survey of the practical side of this technology so far This gap is now filled by the new Handbook of Thermoprocessing Technologies based on the contributions of many highly experienced outstanding engineers working in this field The main intention of this book is the presentation of practical thermal processing for the improvement of material and parts in industrial application Additionally a summary of respective thermal and material science fundamentals is given as well as basic fuel related and electrical engineering knowledge for this technology and finally design aspects components and safety requirements for the necessary heating installations are covered In conclusion a very wide and competent state of the art description is now available for all manufacturers and users of thermoprocessing equipment But also specialists from neighbouring fields students and all those who are generally interested in this important but widely unknown technology will find a quick survey here as well as a very profound expertise
