Numerical simulation has been widely employed to investigate the compressible flows since it is difficult to carry out the experimental measurements especially in the reactive flows The shock wave capturing scheme will be necessary for resolving the compressible flows and moreover the careful treatments of chemical reaction should be considered for proceeding numerical simulation stable and fast Recently the present authors have tried to establish a high resolution numerical solver for computing the compressible reactive flows This chapter presents the numerical procedures acquired in this solver for computing the fluxes using weighted essentially non oscillatory WENO scheme dealing with chemical stiffness problems and tracing droplets and their interaction with the compressible fluids As examples the Taylor Green vortex TGV problem considering the passive scalar mixing the spatially developing reactive mixing layer flows taken gas phase hydrogen and liquid n decane as fuel are simulated respectively Many important characteristics of flow flame and ignition are analyzed under the supersonic condition
