## Science Experiments Usa:

**47 Easy-to-Do Classic Science Experiments** Eugene F. Provenzo,Asterie Baker Provenzo,2012-07-31 Here is a highly motivating book for grade school students that will introduce them to many of the world's most popular and historically significant scientific experiments. They'll learn about gravity simply by following the acrobatic antics of an ordinary coin. By trying to blow an egg out of a cup they'll discover the principles of air pressure. Dancing soap bubbles will help them understand the effects of static electricity and by dropping quarters into a full glass of water without causing it to overflow they'll study the effects of surface tension. These and over 40 other experiments have been carefully selected by noted educators Eugene and Asterie Baker Provenzo to familiarize children with classic science experiments involving optics, inertia, air pressure, magnetism, sound, topology, light, density, vibration, prisms, elasticity, gases, vacuum, perspective, geometry, centrifugal force, buoyancy, color and much more. Some experiments such as the optical Newton's Rings are hundreds of years old. Still others like the straw lever test are based on Greek experiments with leverage and the center of gravity first carried out thousands of years ago. Easy to follow instructions and illustrations show youngsters how to perform each experiment, most of which are prefaced with historical background, a list of necessary materials and an explanation of key terms. Almost all experiments can be carried out with common household items: tissue paper, scissors, tapes, rubber balloons, pens, pencils, etc. and can be worked at home or in the classroom to demonstrate specific scientific principles or to supplement a science curriculum unit. Sources for all historical illustrations given in the text are listed at the end of the book.

**Urban Ecology** Pedro Barbose,2020-11-04 Today 55% of the world's human population lives in urban areas. By 2030 up to 90% of the global human population will live in cities and the global population is expected to increase by 68% by 2050. Although land cover categorized as urban is a relatively small fraction of the total surface of the Earth, urban areas are major driving forces in global environmental change. Habitat loss threatens to biodiversity and the loss of terrestrial carbon stored in vegetation biomass. These and many other factors highlight the need to understand the broad scale impacts of urban expansion as it effects the ecological interactions between humans, wildlife and plant communities. The book stresses the importance of understanding ecological forces and ecosystem services in urban areas and the integration of ecological concepts in urban planning and design. The creation of urban green spaces is critical to the future of urban areas enhancing human social organization, human health and quality of life.
