Partial Regularity For Harmonic Maps And Related Problems:

Partial Regularity for Harmonic Maps and Related Problems Roger Moser, 2005 The book presents a collection of results pertaining to the partial regularity of solutions to various variational problems all of which are connected to the Dirichlet energy of maps between Riemannian manifolds and thus related to the harmonic map problem The topics covered include harmonic maps and generalized harmonic maps certain perturbed versions of the harmonic map equation the harmonic map heat flow and the Landau Lifshitz or Landau Lifshitz Gilbert equation Since the methods in regularity theory of harmonic maps are quite subtle it is not immediately clear how they can be applied to certain problems that arise in applications The book discusses in particular this question

An Introduction to the Regularity Theory for Elliptic Systems, Harmonic Maps and Minimal Graphs Mariano Giaquinta, Luca Martinazzi, 2013-07-30 This volume deals with the regularity theory for elliptic systems We may find the origin of such a theory in two of the problems posed by David Hilbert in his celebrated lecture delivered during the International Congress of Mathematicians in 1900 in Paris 19th problem Are the solutions to regular problems in the Calculus of Variations always necessarily analytic 20th problem does any variational problem have a solution provided that certain assumptions regarding the given boundary conditions are satisfied and provided that the notion of a solution is suitably extended During the last century these two problems have generated a great deal of work usually referred to as regularity theory which makes this topic quite relevant in many fields and still very active for research However the purpose of this volume addressed mainly to students is much more limited We aim to illustrate only some of the basic ideas and techniques introduced in this context confining ourselves to important but simple situations and refraining from completeness In fact some relevant topics are omitted Topics include harmonic functions direct methods Hilbert space methods and Sobolev spaces energy estimates Schauder and L^p theory both with and without potential theory including the Calderon Zygmund theorem Harnack's and De Giorgi Moser Nash theorems in the scalar case and partial regularity theorems in the vector valued case energy minimizing harmonic maps and minimal graphs in codimension 1 and greater than 1 In this second deeply revised edition we also included the regularity of 2 dimensional weakly harmonic maps the partial regularity of stationary harmonic maps and their connections with the case $p = 1$ of the L^p theory including the celebrated results of Wente and of Coifman Lions Meyer Semmes

Nonlinear Dispersive Waves and Fluids Avy Soffer, 2019-03-12 This volume contains the proceedings of the AMS Special Session on Spectral Calculus and Quasilinear Partial Differential Equations and the AMS Special Session on PDE Analysis on Fluid Flows which were held in January 2017 in Atlanta Georgia These two sessions shared the underlying theme of the analysis aspect of evolutionary PDEs and mathematical physics The articles address the latest trends and perspectives in the area of nonlinear dispersive equations and fluid flows The topics mainly focus on using state of the art methods and techniques to investigate problems of depth and richness arising in quantum mechanics general relativity and fluid dynamics

Cartesian Currents in the Calculus of Variations II

Mariano Giaquinta, Giuseppe Modica, Jiri Soucek, 2013-03-14 Non scalar variational problems appear in different fields In geometry for instance we encounter the basic problems of harmonic maps between Riemannian manifolds and of minimal immersions related questions appear in physics for example in the classical theory of models Non linear elasticity is another example in continuum mechanics while Oseen Frank theory of liquid crystals and Ginzburg Landau theory of superconductivity require to treat variational problems in order to model quite complicated phenomena Typically one is interested in finding energy minimizing representatives in homology or homotopy classes of maps minimizers with prescribed topological singularities topological charges stable deformations i e minimizers in classes of diffeomorphisms or extremal fields In the last two or three decades there has been growing interest knowledge and understanding of the general theory for this kind of problems often referred to as geometric variational problems Due to the lack of a regularity theory in the non scalar case in contrast to the scalar one or in other words to the occurrence of singularities in vector valued minimizers often related with concentration phenomena for the energy density and because of the particular relevance of those singularities for the problem being considered the question of singling out a weak formulation or completely understanding the significance of various weak formulations becomes non trivial *Cartesian Currents in the Calculus of Variations I* Mariano

Giaquinta, Giuseppe Modica, Jiri Soucek, 1998-08-19 This monograph in two volumes deals with non scalar variational problems arising in geometry as harmonic mappings between Riemannian manifolds and minimal graphs and in physics as stable equilibrium configurations in nonlinear elasticity or for liquid crystals The presentation is selfcontained and accessible to non specialists Topics are treated as far as possible in an elementary way illustrating results with simple examples in principle chapters and even sections are readable independently of the general context so that parts can be easily used for graduate courses Open questions are often mentioned and the final section of each chapter discusses references to the literature and sometimes supplementary results Finally a detailed Table of Contents and an extensive Index are of help to consult this monograph *Topics in the Calculus of Variations* Martin Fuchs, 2012-12-06 This report grew out of a series of lectures given at the East China Institute of Technology Nanjing during September 1992 The purpose of this book is to make beginning research students familiar with some problems in variational calculus which have been chosen following my

personal taste but with the attempt to illustrate two basic principles in the calculus of variations which are the fundamental question of existence of generalized solutions and closely related the question of regularity Chapter one is devoted to the study of variational integrals for vectorvalued functions which began with the pioneering work of Morrey 68 in the thirties We concentrate on problems where also nonlinear side conditions are imposed on the classes of admissible comparison functions As special cases we include mappings whose range is forced to lie in some Riemannian manifold possibly with boundary or functions whose Jacobian is required to be strictly positive The variational integrals under consideration are typically nonquadratic with respect to the gradient which immediately leads us to classes of degenerate elliptic systems Let

us mention some of the most important applications p harmonic maps between Riemannian manifolds systems of degenerate variational inequalities model problems in nonlinear elasticity Usually by working in appropriate Sobolev spaces the existence of generalized solutions is rather easy to establish see 7 but leads to a priori discontinuous functions
