and a huge dust plume blew across the bay 3 The death of Brayton Point coal power plant illustrates the changing nature of the energy industry While gas plants are not carbon free they do help push coal plants out of the market 4 The biggest global challenge of our day is to slow down and limit the change in the climate so we can live within a habitable climate As a significant contributor of carbon emissions our energy systems will have to rapidly evolve to meet this challenge **Fifth World Congress on Disaster Management: Volume V** S. generation EV charging infrastructure is expected to include interconnected renewable resources such as photovoltaic PV arrays and battery storage systems along with grid edge devices. Although distributed energy resources DERs are useful in several ways such as peak shaving at high demand times and backup supply for added resilience, the integration of vehicle charging and DERs could create more avenues for cyberattack. Physical and/or remote access to EV charging station components including charge ports, power electronics, controllers, and local generation (e.g., PV and energy storage) could be paths to cause power fluctuations leading to altered operations at the charging station, escalated privileges to administrative systems, exfiltration of financial information including personally identifiable information, and reduced grid stability. One compromised EV supply equipment component can open the door to a variety of exploitable vulnerabilities. Cloud computing and mobile application control have the potential to expand the threat surface to non-repudiation and firmware integrity challenges. Vendor clouds have access to hundreds of chargers and if compromised can scale the attack surface exponentially. The high power and voltage levels of xFC infrastructure (e.g., 400 kW at 1000 V DC) increase the hazards and ability to impact the grid and vehicles more than lower power charging systems. Legacy communications systems and protocols could also put EV infrastructure at risk of cyberattacks requiring a robust patch management process. Communications networks link EVs and chargers to several stakeholders including charging station operators, grid operators, vendors, manufacturers, and aggregators who have both physical and network access to share information for control, monitoring, and analytics. Information in these networks that is vulnerable to compromise includes the state of charge, charging duration, payment information, electricity price, and load control. Analyzing and prioritizing these interconnections risks could help address cybersecurity related to data leakage and manipulation.

Electric Vehicle - Smart Grid Integration: Load Modeling, Scheduling, and Cyber Security Yu-Wei Chung, 2020. The modern world has witnessed the surge of electric vehicles (EVs) driven by government policy worldwide to reduce transportation's dependence on fossil fuels. According to Slowik (2019), the global EV market has grown sharply with the annual light-duty EV sales surpassing 2 million in 2018, which is about a 70% increase from 2017. The increase in EV population implies the rise in energy demand and that introduces new challenges to the electricity sector. EV charging load demand in high penetration scenarios, which is foreseen, may lead to stability and quality issues in power grids. Generation capacity and the electricity infrastructure upgrade may be required to address those issues; however, it increases generation costs significantly. The most common EV chargers installed today deliver around 7 kW of power, which is over four times that of an average household power consumption in the US. EV charging load often shows two peaks in a day: one in the morning when people plug in the EV at the workplace and the other in the evening when people get home from work. Without proper energy management for EV charging, the vast power demand due to a large number of plugged-in EVs can stress the electric grid, degrade the electric power quality, and impact the wholesale electricity market. Although an EV battery may store energy up to 80 kWh, which requires more than 10 hours to charge at 7 kW from empty, we

found that most EVs need only 12 kWh per charge or 1.7 hours at 7 kW to meet daily commute requirement while they stay in the parking garage for a more extended period. This implies that EVs can have considerable time flexibility for charging and it is not necessary to start charging right after plugging in, which is likely to result in the charging power adding up. A proper EV charging schedule can well allocate the charging load to prevent power peaks. Therefore, EV charging scheduling can play a significant role in mitigating the adverse effects of vast EV charging demand without upgrading the power grid capacity. To optimize the EV charging schedule while satisfying EVs' charging demand, each EV's stay duration and energy need are essential parameters for the optimization. Those parameters are based on predictions to minimize human intervention. Nonetheless, the uncertainty of EV user behavior poses a challenge to the prediction accuracy. Therefore, this dissertation demonstrates an ensemble machine learning based method to model and predict the EV loads accurately, thereby improving the performance of EV charging scheduling. On the other hand, this smart EV grid integration, which requires massive communication including collecting, transmitting, and distributing real-time data within the network, makes it more susceptible to cyber-physical threats. Potential breaches could not only affect grid operation but also reduce consumers' willingness to adopt EVs over conventional fuel-powered vehicles. This dissertation also presents the vulnerability analysis and risk assessment for a smart EV charging system to develop countermeasures to secure the network. Also, while it is inevitable that the security has flaws, this dissertation provides a novel anomaly detection approach based on the invariant correlations of different measurements within the EV charging network.
