Multirate Statistical Signal Processing Author Omid S Jahromi May 2007:

Multirate Statistical Signal Processing Omid S. Jahromi, 2007-05-15 The field of multirate signal processing has witnessed a great deal of progress and an increasingly wide range of applications since the publication of the first textbook by Crochiere and Rabiner 1983 However this progress has been mainly in the area of deterministic systems with emphasis on perfect reconstruction and orthogonal systems This book introduces a statistical theory for extracting information from signals that have different sampling rates This new theory generalizes the conventional deterministic theory of multirate systems beyond many of its constraints Furthermore it allows for the formulation of several new problems such as spectrum estimation time delay estimation and sensor fusion in the realm of multirate signal processing I have arrived at the theory presented here by integrating concepts from diverse areas such as information theory inverse problems and theory of equalities The process of merging a variety of concepts of different origin results in both merits and shortcomings The former include the fresh and differentiated view of an amateur providing scope of application The latter include a lack of in depth experience in each of the original fields Granted this may lead to gaps in continuity however it goes without saying that a complete theory can seldom be achieved by one person and in a short time My goal in writing this book has been to inspire the reader to initiate his own research and add to the theory of multirate statistical signal processing **Theory of**

Multirate Statistical Signal Processing [microform] Omid S. (Omid Siuof) Jahromi, 2002 Statistical Signal Processing Debasis Kundu, Swagata Nandi, 2012-05-24 Signal processing may broadly be considered to involve the recovery of information from physical observations The received signal is usually disturbed by thermal electrical atmospheric or intentional interferences Due to the random nature of the signal statistical techniques play an important role in analyzing the signal Statistics is also used in the formulation of the appropriate models to describe the behavior of the system the development of appropriate techniques for estimation of model parameters and the assessment of the model performances Statistical signal processing basically refers to the analysis of random signals using appropriate statistical techniques The main aim of this book is to introduce different signal processing models which have been used in analyzing periodic data and different statistical and computational issues involved in solving them We discuss in detail the sinusoidal frequency model which has been used extensively in analyzing periodic data occurring in various fields We have tried to introduce different associated models and higher dimensional statistical signal processing models which have been further discussed in the literature Different real data sets have been analyzed to illustrate how different models can be used in practice Several open problems have been indicated for future research Fundamentals of Statistical Signal Processing Steven M. Kay, 2010

An Introduction to Statistical Signal Processing Robert M. Gray, Lee D. Davisson, 2014-05-14 A guide to the essential tools and techniques of statistical signal processing along with applications **Theory of Multirate Statistical Signal**

Processing and Applications, 2005 This dissertation develops basic theory and applications of statistical multirate signal

processing Specific tools and terminology for describing multirate systems in the time and frequency domains are presented An optimal multirate estimator is derived in both a direct form and recursive form The Recursive form of the optimal estimator allows calculation of the relative change in performance when input signals are added or removed from the multirate system The optimal multirate filtering problem also is specialized to the case of optimal multirate linear prediction An efficient method for calculating the multirate linear prediction coefficients and error variances is developed through the use of the multichannel Levinson recursion and generalized triangular UL factorization Finally a multirate sequential classifier is derived and applied to the problem of target classification It is shown that classifier parameters needed for implementing the multirate sequential classifier are the same as those for multirate linear prediction The methods presented in this dissertation are useful for multisensor fusion particularly when the sensors are operating at different rates
