

Will Climate Change Effect Hazards and Human Health?

Already we see altered weather patterns:

- More frequent and more intense precipitation; damages and repairs more costly
- Longer growing season, more airborne allergens
- More heat waves (>90°F); more in spring and fall
- Warmer winters with heavier snow and more ice
- Higher survival rates for pests (ticks, mosquitos, forest pests)
- Increased risk for algae blooms on lakes/ponds (recent ex. = Stockbridge, Pittsfield)

Natural Hazard Mitigation:

Natural Hazard Mitigation Alessandra Jerolleman, John J. Kiefer, 2012-11-26 One of the four core phases of emergency management hazard mitigation is essential for reducing disaster effects on human populations and making communities more resilient to the impacts of hazards Presenting an up to date look at the changing nature of disasters Natural Hazard Mitigation offers practical guidance on the implementation and selection of hazard mitigation measures and the integration of hazard mitigation into emergency management and other community planning processes

Geomorphology and Natural Hazards Timothy R. Davies, Oliver Korup, John J. Clague, 2021-04-19 Natural disasters are occasional intense events that disturb Earth's surface but their impact can be felt long after hazard events such as earthquakes, volcanoes, drought, and storms can trigger a catastrophic reshaping of the landscape through the erosion, transport, and deposition of different kinds of materials

Geomorphology and Natural Hazards: Understanding Landscape Change for Disaster Mitigation is a graduate level textbook that explores the natural hazards resulting from landscape change and shows how an Earth science perspective can inform hazard mitigation and disaster impact reduction. Volume highlights include:

- Definitions of hazards, risks, and disasters
- Impact of different natural hazards on Earth surface processes
- Geomorphologic insights for hazard assessment and risk mitigation
- Models for predicting natural hazards
- How human activities have altered natural hazards
- Complementarity of geomorphology and engineering to manage threats

Report on Costs and Benefits of Natural Hazard Mitigation Federal Emergency Management Agency, 2013-02-09 Over the last decade the overall cost of disasters to the United States has grown significantly. From 1989 to 1993 the average annual losses from disasters were \$3.3 billion. Over the last 4 years the average annual losses have increased to \$13 billion. On the Federal side alone disasters have cost over \$20 billion over the last four years. The disaster losses are equally as staggering for the American public. Since 1993 over 1.4 million Americans have been impacted by Presidential declared disasters resulting in the loss of their homes, property, communities, jobs, and in some cases their lives. This figure does not include the hundreds of thousands of people impacted by natural hazard events that were managed entirely at the State and local levels and involved the personal savings and private resources of property owners. Indeed the impacts of major disasters on Americans go well beyond those damages that are directly sustained. Recovery from disasters requires resources to be diverted from other important public and private programs and adversely impacts the productivity of economic systems. To many the rising costs associated with natural disasters have become unacceptable. To address this growing problem the Federal Emergency Management Agency (FEMA) under Director James L. Witt has encouraged the emergency management community to become more proactive in reducing the potential for losses before an event occurs. This proactive strategy is commonly known as mitigation. Hazard mitigation is defined as sustained action taken to reduce or eliminate the long term risk to people and property from hazards and their effects. This distinguishes mitigation from other major emergency management functions such as preparedness and training, response, and short term recovery. This emphasis on mitigation led FEMA to introduce a National Mitigation Strategy in December of 1995.

to encourage a national focus on hazard mitigation. The strategy is based on the objective of strengthening the partnership among all levels of government and the private sector and to empower all Americans to fulfill their responsibilities for ensuring safer communities. The strategy was developed with input from State and local officials as well as individuals and organizations with expertise in hazard mitigation. The strategy has two goals to substantially increase the public awareness of natural hazard risk so that the public demands safer communities in which to live and work and to significantly reduce the risk of loss of life, injury, economic costs and destruction of natural and cultural resources that result from natural hazards. The reason for the emphasis on mitigation is clear. Experience at the Federal, State and local levels during natural disasters and a growing body of associated research have demonstrated that the losses from such events in terms of life, property and community resources can be substantially reduced when mitigation techniques and technologies are applied. This paper was prepared to illustrate the comparative benefits and costs associated with the implementation of a variety of mitigation measures by Federal, State and local government and private sector entities. To accomplish this, this paper will identify through a series of case studies the mitigation tools used to achieve cost effective hazard mitigation benefits. The case studies are representative of the types of mitigation measures that are or could be performed elsewhere in the nation under similar conditions.

Given the global impacts of climate change and world wide pattern of increasing losses from natural hazards we necessarily adopt an international perspective. The specific goals of the special issue are to a encompass experiential aspects emphasizing current practice of mitigation and its associated measures and their results and b explore primary or root causes of alarming shifts in human and economic costs of environmental extremes.
