Intelligent and Sustainable Engineering Systems for Industry 4.0 and Beyond Tulsi Pawan Fowdur, Dragorad A. Milovanovic, Zoran S. Bojkovic, 2025-02-21 The Fourth Industrial Revolution Industry 4.0 aims to significantly improve the flexibility, versatility, usability and efficiency of future smart factories. However, the concept of Industry 4.0 is not only limited to the factory but also encompasses the entire life cycle of the product that is from production and suppliers to end users. Industry 4.0 delivers seamless vertical and horizontal integration down the entire value chain and across all layers of the automation pyramid. Industry 4.0 has its roots in a project for the high tech strategy of the German Government back in 2011, which led to the progression of cyber physical systems into cyber physical production systems (CPPS). CPPS can make intelligent decisions through real time communication and cooperation between manufacturing entities. Smart Factory, which is based on CPPS and artificial intelligence (AI), is one of the key associated initiatives of Industry 4.0. This enables flexible production of high quality, personalized products with mass efficiency. Another important aspect of Industry 4.0 is sustainable engineering systems that can help make its processes align with the United Nations Sustainable Development Goals (UN SDGs). Sustainable and intelligent engineering systems such as 5G Industrial IoT, robotics and automation, renewable energy, logistics and even intelligent waste management can be the main enablers of Industry 4.0. This is a multidisciplinary book and is meant for anyone with a basic engineering background interested in acquiring a solid foundation in the fundamental concepts and state of the art research trends in Industry 4.0. It explores the application of AI and machine learning as well as sustainable engineering systems, which can be the main drivers for Industry 4.0 and beyond, and have a significant impact on the UN SDGs.

UAV-Based Remote Sensing Volume 2 Felipe Gonzalez Toro, Antonios Tsourdos, 2018-04-27 This book is a printed edition of the Special Issue UAV-Based Remote Sensing that was published in Sensors. **Advances in Marine Environmental Protection: Challenges, Solutions and Perspectives** Mehran Idris Khan, Yen-Chiang Chang, Wen-Hong Liu, 2025-04-29 Environments have no boundaries and no borders. Managing oceanic environments, particularly the threats and risks of pollution, should also consider the shared responsibility of all coastal states. Emerging issues for oceanic pollution governance include global changes like rising temperature, ocean acidification, but also disturbances of ecosystem functioning by plastic and pollution by other emerging contaminants, for example noise pollution and deep sea mining. These call for efficient and sustainable prevention and restoration strategies, such as such as efficient urban and industrial sewage treatment plants, efficiently administered transnational marine protected areas, and among others sustainable aquaculture, extensive small scale fisheries. Environmental protection warrants the development of interrelationships between marine sciences, relevant industries and ocean governance, developing internationally accepted rules and regulations for sustainable ocean management. This Research Topic will explore possible new domains of ocean governance and the marine environment from the interdisciplinary perspectives of the rule of law, including the international agreement on equal conventions the

Drones for Biodiversity Conservation and Ecological Monitoring Ricardo Díaz-Delgado, Sander

Mücher, 2019-12-18 Unmanned aerial vehicles UAV have already become an affordable and cost efficient tool to quickly map a targeted area for many emerging applications in the arena of ecological monitoring and biodiversity conservation. Managers, owners, companies, and scientists are using professional drones equipped with high resolution visible multispectral or thermal cameras to assess the state of ecosystems, the effect of disturbances or the dynamics and changes within biological communities *inter alia*. We are now at a tipping point on the use of drones for these type of applications over natural areas. UAV missions are increasing but most of them are testing applicability. It is time now to move to frequent revisiting missions aiding in the retrieval of important biophysical parameters in ecosystems or mapping species distributions. This Special Issue shows UAV applications contributing to a better understanding of biodiversity and ecosystem status, threats, changes, and trends. It documents the enhancement of knowledge in ecological integrity parameters, mapping long term ecological monitoring based on drones, mapping of alien species spread and distribution, upscaling ecological variables from drone to satellite images, methods and approaches, rapid risk and disturbance assessment using drones, mapping albedo with UAVs, wildlife tracking, bird colony and chimpanzee nest mapping, habitat mapping and monitoring, and a review on drones for conservation in protected areas.

Armed Drones and the Ethics of War Christian Enemark, 2013-09-11 This book

assesses the ethical implications of using armed unmanned aerial vehicles, hunter killer drones, in contemporary conflicts. The American way of war is trending away from the heroic and towards the post heroic, driven by a political preference for air powered management of strategic risks and the reduction of physical risk to US personnel. The recent use of drones in the War on Terror has demonstrated the power of this technology to transcend time and space but there has been relatively little debate in the United States and elsewhere over the embrace of what might be regarded as politically desirable and yet morally worrisome risk free killing. Arguably the absence of a relationship of mutual risk between putative combatants poses a fundamental challenge to the status of war as something morally distinguishable from other forms of violence and it also undermines the professional virtue of the warrior as a courageous risk taker. This book considers the use of armed drones in the light of ethical principles that are intended to guard against unjust increases in the incidence and lethality of armed conflict. The evidence and arguments presented indicate that in some respects the use of armed drones is to be welcomed as an ethically superior mode of warfare. Over time however their continued and increased use is likely to generate more challenges than solutions and perhaps do more harm than good. This book will be of much interest to students of the ethics of war, airpower, counter terrorism, strategic studies, and security studies in general.

Rebounding Marine Mammal Species

and Conservation Recovery Challenges Andrea Bogomolni, Kristina Cammen, Jennifer Jackman, 2025-03-19 Marine mammals have been valued for millennia for their cultural significance and more often their exploitative resource value. Many large whale species remain imperilled or are only recently returning from the brink of extinction. In contrast recent conservation measures have allowed for the successful rebound and recovery of many cetaceans and pinniped species some to the point of perceived overabundance whether referring to 1 200 Hawaiian monk seals or 7 million harp seals. In addition to their continued intrinsic value alive and thriving today we also appreciate the value of marine mammal species to ecosystem health. Yet as we grapple with a lack of historical baselines and uncertain ecological and social carrying capacities several conflicts are emerging at the growing interface between humans and marine mammals. These conflicts include ship strikes, depredation, bycatch impacts of ecotourism, competition for resources, changing cultural values and political challenges to marine mammal conservation. Despite the emergence of theory and application of human dimensions of wildlife in the terrestrial realm the rebound of marine mammals and how we address these conflicts in the coastal and ocean environment are often overlooked when discussing human-wildlife conflict issues and solutions. This Research Topic aims to increase awareness of these issues to advance the discussion on how we can address these challenges in ocean systems. Conflicts with rebounding populations of marine mammals have emerged across diverse ecological, sociological, economic and political contexts. Conflicts often arise from assessing how marine mammals fit into the human world based on the baseline understanding of one's own personal experiences or specific community contexts rather than broader and complex ecosystems, understanding or historical context. How do we address these emerging complex socio-ecological problems related to marine mammals? Who defines the problems and how are the problems defined? How do we consider often opposing values and interests in the development of solutions and how do we engage diverse stakeholders in decision making processes that shape how we will manage and coexist with marine mammal populations for generations to come? How can different disciplines help build the knowledge foundation and strategies necessary to address these challenges?

Their flight is monitored remotely from the ground or via computers embedded on the vehicle. Previously restricted to military operations these vehicles are increasingly finding applications in the civilian world firefighting, policing, commerce, research and monitoring etc. According to the secretary registration will stress the need for drone operators and hobbyists to observe safe flight practices and apply airspace rules.
