Sanders,Mark Winstanley,2001-07-15 Server Side Flash Scripts Databases and Dynamic Development fills an important gap in the Flash book market With the emergence of e commerce no Web site is complete without a back end because the back end is the virtual sales connection Likewise complex games are dependent on access to huge sets of data that can be sent in small packages but getting them in and out of Flash requires knowing how the data can be generated in Flash how it can be sent out to the servers and how it gets information back from the servers and integrates it into the ongoing game While every book on Flash recognizes this new capacity to some extent none of them have really showed

**Digital Control**  
Richard J. Vaccaro, 1995 This text is aimed at senior level engineering students and can also be used by graduate students and practising engineers whose experience has been limited to continuous time theory and want to see how discrete time systems are designed and or have only seen classical design tools and want to learn modern state space design The increasing use of digital technology in control and signal processing increases the importance of analysis and synthesis tools for discrete time systems The appropriate tool for studying state space models of discrete time systems is linear algebra Although most students take a course in linear algebra they are not usually exposed to advanced engineering applications in such a course The material found in this text equips students to analyze and design discrete time digital systems and shows how linear algebra and state space system theory are used to design digital control systems
