Ramo Tello, 2022-09-19 We all agree that people with MS need to be cared in a profoundly personalized way The care of the patient with MS is still based on the presence of relapses so their successful diagnosis and treatment is fundamental and will condition the therapeutic strategies to follow with the patient The treatment strategies are a highly controversial topic of debate that is increasingly supported by robust objective biological markers of response and that also increasingly take into account the dynamics and predictors of cognitive impairment along the disease course which includes the adoption of new trends in the field of machine learning techniques However we all know that patient care goes beyond being treated with drugs and we cannot overlook reminding patients of the importance of their lifestyle behaviors that vary according to the MS biological markers in order to improve their quality of life Teleconsultation is a new care strategy proved to be feasible and well received by patients with MS that will undoubtedly become reinforced because it will allow a closer follow up of the patient without the need for displacement

*Handbook of Multiple Sclerosis* Jeffrey A. Cohen, Alexander Rae-Grant, 2013-11-05 Over the past 30 years there have been significant advances in our understanding of multiple sclerosis MS due to the use of MRIs to better visualize the disease and because of the introduction of new ameliorating drugs However MS is still an incurable disease and diagnosis remains challenging for many physicians for instance symptoms often mimic MS and there is not a specific test for the disease To ensure optimal patient care there is a need for physicians to remain up to date with new drugs on the market disease detection diagnosis and latest management options The Handbook of Multiple Sclerosis Second Edition provides a concise easily assessable guide for all healthcare professionals involved in the diagnosis and management of this condition including standard therapies as well as more novel treatments The book includes comprehensive evaluations of the pharmacological treatments available including novel investigational agents currently in development

**Multiple Sclerosis** Alireza Minagar, 2014-09-01 Multiple sclerosis MS is one of the most common autoimmune mediated diseases of the human central nervous system CNS which affects young adults and usually causes significant neurological disability Currently the causes of MS are still unclear a cure for MS remains elusive and the effectiveness of treatment varies significantly among individuals Clinical features and neurological deficits stemming from this progressive neurological disease are diverse since MS potentially affects human CNS at all levels from brain to the end of spinal cord The triggering event for development of MS remains unknown Immunopathogenesis of MS involves a number of steps which include activation of peripheral leukocytes against putative CNS antigen s interactions of the activated

leukocytes with inflamed cerebral endothelial cells transendothelial migration of activated lymphocytes and macrophages to the CNS milieu and further propagation of the massive immune response within the CNS. Such massive immune activation leads to loss of myelin oligodendrocyte complex. Several immune cell types and mediators of the immune inflammatory response actively contribute to pathogenesis of MS. Genetic factors are also believed to play a central role in the development of most forms of MS. Another important but much unrecognized and under researched feature of MS immunopathology is neurodegeneration. Neuronal loss and axonal degeneration are the core components of irreversible and permanent CNS atrophy and disability in MS. What we call MS in reality is a heterogeneous group of diseases and at least four distinct immunopathological subtypes of MS with dissimilar responses to therapy with immunomodulatory agents exist. MS is a clinical diagnosis however its diagnostic process is much facilitated by utilization of laboratory and neuroimaging studies. Present therapies of MS are either immunomodulatory agents or immunosuppressive and mainly target the peripheral immune system with the intention to ameliorate the severity of acute relapses, decrease annual relapse rate and improve MRI lesions. Currently much research activity is being conducted to better understand the fundamental disease mechanisms of MS and find more effective and safer treatments for this incurable disease. This book presents an overview of MS as a disease with neuroinflammatory and neurodegenerative features and the authors discuss the most recent findings about MS and its treatment.
