Thus if the guage of the boiler shews a considerably greater force of steam than the indicator at the cylinder it argues something wrong in the steam pipe if an important difference exists between the vacuum in the cylinder and that in the condenser then it is evident that some defect exists either in the steam passage or in the working of the steam valve The indicator therefore shews how the component parts of the engine work together and its application becomes very useful at intervals of nine and twelve months but the mechanism of this instrument is too complicated to enable me to give a clear description of it upon paper

CHAPTER II A description of the Machinery The Machinery may be mainly considered under two heads firstly those parts which are directly connected with the steam and secondly those which are engaged in communicating the motion to the paddle wheels Under the first head will be described 1 The boiler fig I 2 The bed plate condenser and hot well r and s in adjoining plate 3 The cylinder steam valve and air pump t w v in adjoining plate Under the second head will be arranged see adjoining plate 1 Piston and piston rod a 2 Cross head b 3 Side rods c 4 Radius bars and shaft dj 5 Side rod of parallel motion ej 6
