Phage Therapy: Past, Present and Future Stephen T. Abedon, Pilar García, Peter Mullany, Rustam Aminov, 2017-09-05 Historically the first observation of a transmissible lytic agent that is specifically active against a bacterium *Bacillus anthracis* was by a Russian microbiologist Nikolay Gamaleya in 1898 At that time however it was too early to make a connection to another discovery made by Dmitri Ivanovsky in 1892 and Martinus Beijerinck in 1898 on a non bacterial pathogen infecting tobacco plants Thus the viral world was discovered in two of the three domains of life and our current understanding is that viruses represent the most abundant biological entities on the planet The potential of bacteriophages for infection treatment have been recognized after the discoveries by Frederick Twort and Felix d H relle in 1915 and 1917 Subsequent phage therapy developments however have been overshadowed by the remarkable success of antibiotics in infection control and treatment and phage therapy research and development persisted mostly in the former Soviet Union countries Russia and Georgia as well as in France and Poland The dramatic rise of antibiotic resistance and especially of multi drug resistance among human and animal bacterial pathogens however challenged the position of antibiotics as a single most important pillar for infection control and treatment Thus there is a renewed interest in phage therapy as a possible additive alternative therapy especially for the infections that resist routine antibiotic treatment The basis for the revival of phage therapy is affected by a number of issues that need to be resolved before it can enter the arena which is traditionally reserved for antibiotics Probably the most important is the regulatory issue How should phage therapy be regulated Similarly to drugs Then the co evolving nature of phage bacterial host relationship will be a major hurdle for the production of consistent phage formulae Or should we resort to the phage products such as lysins and the corresponding engineered versions in order to have accurate and consistent delivery doses We still have very limited knowledge about the pharmacodynamics of phage therapy More data obtained in animal models are necessary to evaluate the phage therapy efficiency compared for example to antibiotics Another aspect is the safety of

phage therapy How do phages interact with the immune system and to what costs or benefits What are the risks in the course of phage therapy of transduction of undesirable properties such as virulence or antibiotic resistance genes How frequent is the development of bacterial host resistance during phage therapy Understanding these and many other aspects of phage therapy basic and applied is the main subject of this Topic **Pain Mechanisms and Modulators Editor's Picks 2021** Robert John Vandenberg,2021-07-21 **Epitope mapped vaccines and diagnostics for emerging pathogens** Tarek A. Ahmad,Adriana Harbuzariu,2023-01-31 **Kelley's Textbook of Rheumatology** Gary S. Firestein,William N. Receptor Binding Techniques Anthony P. Davenport,2012-06-12 A broad definition of a receptor is a specialized protein on or in a cell that recognizes and binds a specific ligand to undergo a conformational change leading to a physiological response or change in cell function A ligand can be an endogenous neurotransmitter hormone paracrine autocrine factor or a synthetic drug that may function as an agonist or antagonist The third edition of Receptor Binding Techniques expands upon the methods and techniques used for studying receptors in silico in vitro and in vivo Comprehensive chapters describe how to use online resources for experimental research such as prediction of receptor ligand interactions and mine the IUPHAR receptor database Classical techniques of radioligand binding quantitative autoradiography and their analyses are complemented by the use of immunocytochemistry for the cellular localization of receptor protein and hybridization to detect receptor mRNA Protocols using fluorescent labeled ligands are described to visualise receptors in living cells their interaction with beta arrestin to measure ligand induced internalisation and green fluorescent protein to study trafficking Non radioactive chemiluminescent cAMP and arrestin assays facilitate the identification of novel biased agonists Detailed methods are provided for in vivo imaging of receptors using positron emission tomography PET Written in the highly successful Methods in Molecular Biology™ series format chapters include introductions to their respective topics lists of the necessary materials and reagents step by step readily reproducible laboratory protocols and key tips on troubleshooting and avoiding known pitfalls Authoritative and practical Receptor Binding Techniques Third Edition aids scientists in continuing to study receptor binding
