of Microfluidic Tools for Biological Applications Walter Settimo Leonardo Minnella, 2017 The topic of this manuscript is the development of microdevices based on lab on chip LOC technology aimed to the environmental control and regulation of biological systems for macro and microbiological applications Indeed microfluidics possesses some inherent features which allow the manipulation of the environment at the cell and sub cell level which are superior than the degree of control achievable with standard techniques In this thesis work the possibility to leverage these features to develop inexpensive yet effective diagnostic tools is explored In particular we report the development of microfluidic systems which allow seamless and fast media perfusion and a novel LOC platform capable of performing highly multiplexed real time PCR assays Concerning the microfluidic perfusion systems the aim was to achieve in flow substitution of the particles surrounding media in order to enhance the separation capabilities of the coupled microfluidic sorting modules The effectiveness of our approach was validated by obtaining high separation purities 90% using our microfluidic perfusion system coupled with an acoustophoresis chip to discern two population of micro sized beads Moreover we conceived and developed a microfluidic thermalisation system capable of sub second temperature switches Specifically this platform relies on conductive heat exchange between a thermalisation liquid flowing inside a microfluidic chip and the biological sample These thermalisation performances and the high surface to volume ratio typical of microfluidic devices allowed to perform 50 qPCR cycles and subsequent melting curve analysis in less than ten minutes
