researchers in polymers polymer composites and materials science **Multi-Scale Continuum Mechanics Modelling of Fibre-Reinforced Polymer Composites** Wim Van Paepegem, 2020-11-25 Multi scale modelling of composites is a very relevant topic in composites science This is illustrated by the numerous sessions in the recent European and International Conferences on Composite Materials but also by the fast developments in multi scale modelling software tools developed by large industrial players such as Siemens Virtual Material Characterization toolkit and MultiMechanics virtual testing software MSC e Xstream Digimat software Simulia micromechanics plug in in Abaqus HyperSizer Multi scale design of composites Altair Altair Multiscale Designer This book is intended to be an ideal reference on the latest advances in multi scale modelling of fibre reinforced polymer composites that is accessible for both young researchers and end users of modelling software We target three main groups This book aims at a complete introduction and overview of the state of the art in multi scale modelling of composites in three axes ranging from prediction of homogenized elastic properties to nonlinear material behaviour ranging from geometrical models for random packing of unidirectional fibres over meso scale geometries for textile composites to orientation tensors for short fibre composites ranging from damage modelling of unidirectionally reinforced composites over textile composites to short fibre reinforced composites The book covers the three most important scales in multi scale modelling of composites i micro scale ii meso scale and iii macro scale The nano scale and related atomistic and molecular modelling approaches are deliberately excluded since the book wants to focus on continuum mechanics and there are already a lot of dedicated books about polymer nanocomposites A strong focus is put on physics based damage modelling in the sense that the chapters devote attention to modelling the different damage mechanisms matrix cracking fibre matrix debonding delamination fibre fracture in such a way that the underlying physics of the initiation and growth of these damage modes is respected The book also gives room to not only discuss the finite element based approaches for multi scale modelling but also much faster methods that are popular in industrial software such as Mean Field Homogenization methods based on Mori Tanaka and Eshelby solutions and variational methods shear lag theory and more advanced theories Since the book targets a wide audience the focus is put on the most common numerical approaches that are used in multi scale modelling Very specialized numerical methods like peridynamics modelling Material Point Method eXtended Finite Element Method XFEM isogeometric analysis SPH Smoothed Particle Hydrodynamics are excluded Outline of the book The book is divided in three large parts well balanced with each a similar number of chapters

Progress in Adhesion and Adhesives K. L. Mittal, 2015-07-27 This book is based on the 13 review articles written by subject experts and published in 2014 in the Journal Reviews of Adhesion and Adhesives The rationale for publication of this book is that currently the RAA has limited circulation so this book provides broad exposure and dissemination of the concise critical illuminating and thought provoking review articles The subjects of the reviews fall into 4 general areas 1 Polymer surface modification 2 Biomedical pharmaceutical and dental fields 3 Adhesives and adhesive joints 4 General Adhesion

Multi-scale Analysis of Composite Materials Using CalculiX and the Method of Cells Francisco A. Yapor Genao, 2018 A unified analysis framework is presented that makes available multiscale analysis of composite structures using the open source FEA solver package CalculiX CrunchiX CCX At the center of this framework is the coupling and use of the Finite Element Analysis Micromechanics Analysis Code FEAMAC library from NASA s Micromechanics Analysis Code with Generalized Method of Cells MAC GMC coupled with CCX to allow multiscale analysis This implementation allows performing nonlinear micromechanics simulation using the Generalized Method of Cells GMC at each integration point of the FEA model and receive homogenized material response provided at each increment of the simulation This framework follows the execution principle of FEAMAC with Abaqus which is the initial implementation of this framework using the commercial FEA package Abaqus Standard The evaluation method for the proposed framework is to compare three validated examples purely structural problems i e no thermal from the distribution of FEAMAC The error between the methods was calculated for each model and material orientation using the reference values from FEAMAC with Abaqus documentation The reported values were taken at their relative extrema over the range of respective unit of measure for the particular problem The most significant error reported was in a composite beam four point bend test specimen with less than 1 % difference These results show that the proposed coupling can be used with appropriate care for multiscale FEA simulations of composite materials This work represents the first step to support the use and growth of the audience who can utilize multiscale analysis for composite materials and structures using the low cost efficient tools such as MAC GMC code and the open source FEA package CCX
