Observation Of The Earth System From Space:

Observation of the Earth System from Space Jakob Flury,Reiner Rummel,Christoph Reigber,Markus Rothacher,Gerd Boedecker,Ulrich Schreiber,2006-02-28 In the recent years space based observation methods have led to a substantially improved understanding of Earth system Geodesy and geophysics are contributing to this development by measuring the temporal and spatial variations of the Earth's shape gravity field and magnetic field as well as at sphere density In the frame of the German R D programme GEOTECHNOLOGIEN research projects have been launched in 2002 related to the satellite missions CHAMP GRACE and ESA's planned mission GOCE to complementary terrestrial and airborne sensor systems and to consistent and stable high precision global reference systems for satellite and other techniques In the initial 3 year phase of the research programme 2002-2004 new gravity field models have been computed from CHAMP and GRACE data which outperform previous models in accuracy by up to two orders of magnitude for the long and medium wavelengths A special highlight is the termination of seasonal gravity variations caused by changes in continental water masses For GOCE to be launched in 2006 new gravity field analysis methods are under development and integrated into the ESA processing system 200 000 GPS radio occultation profiles observed by CHAMP have been processed on an operational basis They represent new and excellent information on atmospheric refractivity temperature and water vapor These new developments require geodetic space techniques such as VLBI SLR LLR GPS to be combined and synchronized as if being one global instrument

Observation of the Earth and Its Environment Herbert J. Kramer,2002 Windows Macintosh Version **Thriving on Our Changing Planet** National Academies of Sciences, Engineering, and Medicine,Division on Engineering and Physical Sciences,Space Studies Board,Committee on the Decadal Survey for Earth Science and Applications from Space,2019-01-20 We live on a dynamic Earth shaped by both natural processes and the impacts of humans on their environment It is in our collective interest to observe and understand our planet and to predict future behavior to the extent possible in order to effectively manage resources successfully respond to threats from natural and human induced environmental change and capitalize on the opportunities social economic security and more that such knowledge can bring By continuously monitoring and exploring Earth developing a deep understanding of its evolving behavior and characterizing the processes that shape and reshape the environment in which we live we not only advance knowledge and basic discovery about our planet but we further develop the foundation upon which benefits to society are built Thriving on Our Changing Planet presents prioritized science applications and observations along with related strategic and programmatic guidance to support the U S civil space Earth observation program over the coming decade **Advances in Earth Observation of Global Change** Emilio Chuvieco,Jonathan Li,Xiaojun Yang,2010-08-04 Global Change studies are increasingly being considered a vital source of information to understand the Earth Environment in particular in the framework of human induced climate change and land use transformation Satellite Earth Observing systems provide a unique tool to monitor those changes While the range of

applications and innovative techniques is constantly increasing this book provides a summary of key case studies where satellite data offer critical information to understand the causes and effects of those environmental changes minimizing their negative impacts This book will be of interest to researchers and practitioners in the field of remote sensing geographical information meteorology and environmental sciences Also scientists and graduate up to post graduate level students in environmental science will find valuable information in this book *Earth Observations from Space* National Research Council, Division on Earth and Life Studies, Board on Atmospheric Sciences and Climate, Committee on Scientific Accomplishments of Earth Observations from Space, 2008-01-17 Over the past 50 years thousands of satellites have been sent into space on missions to collect data about the Earth Today the ability to forecast weather climate and natural hazards depends critically on these satellite based observations At the request of the National Aeronautics and Space Administration the National Research Council convened a committee to examine the scientific accomplishments that have resulted from space based observations This book describes how the ability to view the entire globe at once uniquely available from satellite observations has revolutionized Earth studies and ushered in a new era of multidisciplinary Earth sciences In particular the ability to gather satellite images frequently enough to create movies of the changing planet is improving the understanding of Earth's dynamic processes and helping society to manage limited resources and environmental challenges The book concludes that continued Earth observations from space will be required to address scientific and societal challenges of the future **Scientific Satellite and Moon-Based Earth Observation for Global Change** Huadong

Guo, Wenxue Fu, Guang Liu, 2019-06-27 Global change involves complex and far reaching variations in the Earth's systems and satellite observations have been widely used in global change studies Over the past five decades Earth observation has developed into a comprehensive system that can conduct dynamic monitoring of the land the oceans and the atmosphere at the local regional and even global scale At the same time although a large number of Earth observation satellites have been launched very few of them are used in global change studies The lack of scientific satellite programs greatly hinders research on global change This book proposes using a series of global change scientific satellites to establish a scientific observation grid for global environmental change monitoring from space and offers the first comprehensive review of lunar based Earth observation These scientific satellites could provide not only basic datasets but also scientific support in facilitating advances in international global change research **Satellite Observations of the Earth's Environment** Committee on

NASA-NOAA Transition from Research to Operations, 2003-06-06 This report addresses the transition of research satellites instruments and calculations into operational service for accurately observing and predicting the Earth's environment These transitions which take place in large part between NASA and NOAA are important for maintaining the health safety and prosperity of the nation and for achieving the vision of an Earth Information System in which quantitative information about the complete Earth system is readily available to myriad users Many transitions have been ad hoc sometimes taking several

years or even decades to occur and others have encountered roadblocks lack of long range planning resources institutional or cultural differences for instance and never reached fruition Satellite Observations of Earth's Environment recommends new structures and methods that will allow seamless transitions from research to practice

Continuity of NASA Earth Observations from Space National Academies of Sciences, Engineering, and Medicine, Division on Engineering and Physical Sciences, Space Studies Board, Committee on a Framework for Analyzing the Needs for Continuity of NASA-Sustained Remote Sensing Observations of the Earth from Space, 2015-11-24 NASA's Earth Science Division ESD conducts a wide range of satellite and suborbital missions to observe Earth's land surface and interior biosphere atmosphere cryosphere and oceans as part of a program to improve understanding of Earth as an integrated system Earth observations provide the foundation for critical scientific advances and environmental data products derived from these observations are used in resource management and for an extraordinary range of societal applications including weather forecasts climate projections sea level change water management disease early warning agricultural production and the response to natural disasters As the complexity of societal infrastructure and its vulnerability to environmental disruption increases the demands for deeper scientific insights and more actionable information continue to rise To serve these demands NASA's ESD is challenged with optimizing the partitioning of its finite resources among measurements intended for exploring new science frontiers carefully characterizing long term changes in the Earth system and supporting ongoing societal applications This challenge is most acute in the decisions the Division makes between supporting measurement continuity of data streams that are critical components of Earth science research programs and the development of new measurement capabilities This report seeks to establish a more quantitative understanding of the need for measurement continuity and the consequences of measurement gaps Continuity of NASA's Earth's Observations presents a framework to assist NASA's ESD in their determinations of when a measurement or dataset should be collected for durations longer than the typical lifetimes of single satellite missions

Observing the Earth from space Cathy Dubois, Michel Avignon, Philippe Escudier, 2014-06-11 Breaking free of the Earth's surface to look down from above is longer a mere dream Sophisticated instruments flown on satellites produce streams of data that when inserted into complex information processes increase our knowledge of the Earth system Satellites have now revealed the limits and potential of our planet by making them visible This book describes how satellite observation offers unique support in fields such as the management of natural environments risk prevention and post disaster management Beginning with an historical review it then traces how data are constructed from the initial conception of measurements to their interpretation for use in operational systems Ongoing sociological surveys sketch out some of the difficulties to be overcome to allow more widespread use of satellite data With the help of concrete examples such as emergency mapping for disaster management or monitoring of water resources readers are shown how space based observation offers potential cognitive resources for living on Earth while taking care of it

Earth System Monitoring John Orcutt, 2012-12-12 Modern Earth System Monitoring represents a fundamental change in the way scientists study the Earth System In Oceanography for the past two centuries ships have provided the platforms for observing Expeditions on the continents and Earth's poles are land based analogues Fundamental understanding of current systems climate natural hazards and ecosystems has been greatly advanced While these approaches have been remarkably successful the need to establish measurements over time can only be made using Earth observations and observatories with exacting standards and continuous data The 19 peer reviewed contributions in this volume provide early insights into this emerging view of Earth in both space and time in which change is a critical component of our growing understanding
