historical development there are different unrelated systems of nomenclature for inorganic chemistry organic chemistry polymer chemistry natural products chemistry etc With each new discovery in the laboratory as well as each new theoretical proposal for a chemical the lines that traditionally have separated these distinct subsets of matter continually grow more blurred This lack of uniformity in characterizing and naming chemicals increases the communication difficulties between differently trained chemists as well as other scientists and greatly impedes progress With the set of known chemicals numbering over 42 000 000 in Chemical Abstracts data base and continually growing about 2 000 new additions every day the desirability for a unified system for naming all chemicals simultaneously grows Moreover in order to meet the requirements of disparate groups of scientists and of society in general the name assigned to a given chemical should not only uniquely describe that substance but also should be a part of a readily recognizable order for the entire field For these purposes a topology based bi parametric system of nomenclature is herein proposed In this book a new nomenclature system is proposed The new nomenclature is applicable to a three dimensional world and is internally consistent This nomenclature

unifies ALL branches of chemistry removing the need for various presently existing sets of rules      *Rules for Nomenclature of Chemical Compounds* International Union of Pure and Applied Chemistry,1934      *The Naming and Indexing of Chemical Compounds from Chemical Abstracts*. -.
