Nanostructured Polymer Blends and Composites in Textiles Mihai Ciocoiu, Seghir Maamir, 2016-01-05 This new volume reviews recent academic and technological developments behind new engineered modified nanotextile materials. The developments in textiles using nanotechnology give ordinary materials improved properties such as better water resistance, enhanced moisture and odor reduction, increased strength and elasticity, and resistance to bacteria. Nanostructured Polymer Blends Sabu Thomas, Robert Shanks, Sarath Chandran, 2013-11-28 Over 30% of commercial polymers are blends or alloys of one kind or another. Nanostructured blends offer the scientist or plastics engineer a new range of possibilities with characteristics including thermodynamic stability, the potential to improve material transparency, creep, and solvent resistance, the potential to simultaneously increase tensile strength and ductility, superior rheological properties, and relatively low cost. Nanostructured Polymer Blends opens up immense structural possibilities via chemical and mechanical modifications that generate novel properties and functions and high performance characteristics at a low cost. The emerging applications of these new materials cover a wide range of industry sectors encompassing the coatings and adhesives industry, electronics, energy, photovoltaics, aerospace, and medical devices, where polymer blends provide innovations in biocompatible materials. This book explains the science of nanostructure formation and the nature of interphase formations, demystifies the design of nanostructured blends to achieve specific properties, and introduces the applications for this important new class of nanomaterial. All the key topics related to recent advances in blends are covered: IPNs, phase morphologies, composites, and nanocomposites; nanostructure formation; the chemistry and structure of additives, etc. Introduces the science and technology of nanostructured polymer blends and the procedures involved in melt blending and chemical blending to produce new materials with specific performance characteristics. Unlocks the potential of nanostructured polymer blends for applications across sectors including electronics, energy, photovoltaics, aerospace, automotive, and medical devices, biocompatible polymers. Explains the performance benefits in areas including rheological properties, thermodynamic stability, material transparency, solvent resistance, etc.

Nanostructured Polymer Blends

Juan Rodríguez-Hernández, 2013-11-28 The design of polymer blends constitutes an interesting alternative to obtaining micro and nanostructured surfaces. The cost is reasonable and it is free from time consuming procedures. Blending of polymers can yield materials with unprecedented properties that cannot be provided otherwise by using a single polymer

The free surface topography of polymer blend films often related to phase domain structure is critical to the applications Two main aspects need to be considered in the preparation of multistructured blends the interfaces involved and the morphology to be obtained The control of these two aspects depends further on materials related parameters involving the composition of the blend the interfacial tension or viscosity ratio and the processing conditions related to the temperature time or intensity of mixing among others Both domain structure and topography of the blend films have garnered increasing interest over the past decade This chapter describes the nanomicrostructures formed at the polymer surface from polymer blends Despite the crucial role that surfaces play in the final application of the material up to now most of the studies concerning polymer blends have been related to the control of the mechanical properties toughness stiffness thermal expansion etc their barrier properties or the electrical conductivity This chapter focuses on the analysis of the structured polymer surfaces and thin films giving an overview of the role of these structures on the final application The principles of phase separation and the resulting structures formed are briefly discussed followed by a wide overview of the possibilities of producing stimuli responsive interfaces by introducing among other things pH or temperature responsive polymers within the blend Finally we look at how using particular preparation conditions and or self assembly of block copolymers the formation of films and surfaces with hierarchical order length scales can be induced We also examine the main areas in which multiscale ordered interfaces obtained from polymer blends have been applied

and science and engineering of compatibilization During the last few decades the addition of nanoparticles nanowires nanotubes and so on has advanced even further the creation of blends alloys and composites with different polymers In making these blends intermediaries such as compatibilizers coupling agents and other additives are often employed to bring about blends that are satisfactory for the purposes they are intended to serve Nanostructured polymer blends formation has strongly improved the properties and structural integrities of polymer blends by employing compatibilization as a tool to achieve such properties and structural integrities of polymer blends Reinforcing compatibilized polymer blends with nanosize additives has further strengthened the properties and integrities of polymer blends alloys and composites *Textile Technology Digest* ,2002 *Chemical Abstracts* ,2002 **Composites Industry Abstracts** ,1996
