## Methods For Solving Mathematical Physics Problems:

**Methods for Solving Mathematical Physics Problems** Valerii Ivanovich Agoshkov, P. B. Dubovski, V. P. Shutayev, 2006 The aim of the book is to present to a wide range of readers students postgraduates scientists engineers etc basic information on one of the directions of mathematics methods for solving mathematical physics problems. The authors have tried to select for the book methods that have become classical and generally accepted. However, some of the current versions of these methods may be missing from the book because they require special knowledge. The book is of the handbook teaching type. On the one hand the book describes the main definitions the concepts of the examined methods and approaches used in them and also the results and claims obtained in every specific case. On the other hand proofs of the majority of these results are not presented and they are given only in the simplest methodological cases. Another special feature of the book is the inclusion of many examples of application of the methods for solving specific mathematical physics problems of applied nature used in various areas of science and social activity such as power engineering environmental protection hydrodynamics elasticity theory etc. This should provide additional information on possible applications of these methods. To provide complete information the book includes a chapter dealing with the main problems of mathematical physics together with the results obtained in functional analysis and boundary value theory for equations with partial derivatives. It covers up to date methods of linear and nonlinear analysis the theory of differential equations in Banach spaces app. **Traditional Functional-Discrete Methods for the Problems of Mathematical Physics** Volodymyr Makarov, Nataliya Mayko, 2024-03-26 This book is devoted to the construction and study of approximate methods for solving mathematical physics problems in canonical domains. It focuses on obtaining weighted a priori estimates of the accuracy of these methods while also considering the influence of boundary and initial conditions. This influence is quantified by means of suitable weight functions that characterize the distance of an inner point to the boundary of the domain. New results are presented on boundary and initial effects for the finite difference method for elliptic and parabolic equations mesh schemes for equations with fractional derivatives and the Cayley transform method for abstract differential equations in Hilbert and Banach spaces. Due to their universality and convenient implementation the algorithms discussed throughout can

**A Collection of Problems on the Equations of Mathematical Physics** Vasilij S. Vladimirov,2013-11-09 The extensive application of modern mathematical techniques to theoretical and mathematical physics requires a fresh approach to the course of equations of mathematical physics This is especially true with regards to such a fundamental concept as the solution of a boundary value problem The concept of a generalized solution considerably broadens the field of problems and enables solving from a unified position the most interesting problems that cannot be solved by applying classical methods To this end two new courses have been written at

the Department of Higher Mathematics at the Moscow Physics and Technology Institute namely Equations of Mathematical Physics by V S Vladimirov and Partial Differential Equations by V P Mikhailov both books have been translated into English by Mir Publishers the first in 1984 and the second in 1978 The present collection of problems is based on these courses and amplifies them considerably Besides the classical boundary value problems we have included a large number of boundary value problems that have only generalized solutions Solution of these requires using the methods and results of various branches of modern analysis For this reason we have included problems in Lebesgue integration problems involving function spaces especially spaces of generalized differentiable functions and generalized functions with Fourier and Laplace transforms and integral equations
