Williams,2011-06-16 How does one effectively aggregate disparate pieces of information that are spread among many different individuals In other words how does one best access the wisdom of the crowd Prediction markets which are essentially speculative markets created for the purpose of aggregating information and making predictions offer the answer to this question The effective use of these markets has the potential not only to help forecast future events on a national and international level but also to assist companies for example in providing improved estimates of the potential market size for a new product idea or the launch date of new products and services The markets have already been used to forecast uncertain outcomes ranging from influenza to the spread of infectious diseases to the demand for hospital services to the box office success of movies climate change vote shares and election outcomes to the probability of meeting project deadlines The insights gained also have many potentially valuable applications for public policy more generally These markets offer substantial promise as a tool of information aggregation as well as forecasting whether alone or as a supplement to other mechanisms like opinion surveys group deliberations panels of experts and focus groups Moreover they can be applied at a macroeconomic and microeconomic level to yield information that is valuable for government and commercial policy makers and which can be used for a number of social purposes This volume of original readings contributed by many of the leading experts in the field marks a significant addition to the base of knowledge about this fascinating subject area The book should be of interest to anyone looking at monetary economics economic forecasting and microeconomics

Halgamuge,Thrishantha Nanayakkara,Thas Nirmalathas,2016-05-16 The expected time of impact also known as the mean first passage time MFPT to reach failure is a critical metric in the management of natural disasters The complexity of the dynamics governing natural disasters lead to stochastic behaviour This book shows that state transitions of many such systems translate into random walks on their respective state spaces biased and shaped by environmental inhomogeneity Thus the probabilistic treatment of those random walks gives valuable insights of expected behaviour A comprehensive case study of predicting cyclone induced flood is followed by a discussion of generic methods that predict MFPT addressing directional bias This is followed by discussing MFPT prediction methods in systems showing network inhomogeneity All presented methods are illustrated using real datasets of natural disasters The book ends with a short discussion of possible future research areas introducing the problem of predicting MFPT for bush fire propagation
