**Immunochemistry of Viruses II** M. H. V. Van Regenmortel, A. Robert Neurath, 1990 The aim of this second volume of *Immunochemistry of Viruses* remains very much the same as that of the first to assemble under one cover data on the antigenic properties of a wide range of different viruses The belief upheld by the contributors is that this helps to reveal the underlying unity of viral immunology and immunochemistry in so much that the advances made in techniques and analytical concepts through studying one particular group of viruses usually are applicable to most other groups Our knowledge of the antigenic properties of viruses is expanding very rapidly and the present volume has been compiled in the light of the major advances made in viral immunology since the first volume appeared five years ago *Immunochemistry of Viruses II* devotes five chapters to reviewing areas of research in which considerable progress has been made including processing of antigens local immunity and autoimmunity Three chapters focus on applications of recombinant DNA technology and synthetic peptides and the remaining 15 chapters each deal with the antigenic structure of distinct families of viruses In view of the

extensive research developments of past years several topics discussed in the previous volume such as picorna and influenza viruses have been updated and also included in volume II Additional virus families and groups discussed include the arena bunya corona lenti and poxviruses as well as bacteriophages

Kaufmann, 2004-03-12 The protection mode of the majority of vaccines is based on the induction of antibody responses Since efficient immune responses to many pathogens rely on activating all arms of the immune system traditional vaccine development does not provide efficient protection against many diseases Novel vaccination strategies need to allow presentation of antigens that can activate the full array of the immune response and should prevent pathogen entry by mobilizing the local mucosal immune response New technological advances make it possible to optimize the immunogenicity of live and sub unit vaccines This book offers an interdisciplinary overview on research and future strategies for rational vaccine design based on recent developments in molecular biology and immunology It covers new aspects of the immunological interplay between prokaryotic and eukaryotic systems as well as achievements in the development of novel vaccine candidates Chapters on edible vaccines on vaccines against bioterror agents and on economical and safety aspects of novel vaccine development round off this title
