Oral Cancer Diagnosis And Therapy:

Oral Cancer Tadaaki Kiritani, Ken Omura, 2015-02-24 Oral cancer is frequently diagnosed late when the disease has advanced with lesions that are large and deeply invasive and with metastasis to regional lymph nodes leading to increased mortality. Moreover, late diagnosis and treatment often result in considerable morbidity of oral and maxillofacial structures and poor appearance and function following therapy. This book provides head and neck oncologists, oral oncologists, oral and maxillofacial surgeons, medical oncologists, dentists, and other members of dental teams furnishing supportive care with a systematic review of recent diagnostic and therapeutic advances in oral cancer. The various authoritative chapters are prepared by specialists who are active leaders in each basic and clinical field. All chapters address individual and collective issues that arise in managing oral cancer patients with difficult treatment problems and provide insight into the multiple valid management approaches available. The authors offer an extensive source of information about oral cancers and encourage the clinician to be flexible and innovative, giving physicians and medical personnel the background information to make the best educated responsible decisions for individual patients.

Multidisciplinary Management of Oral Cancer: Diagnosis, Treatment, and Rehabilitation Pasquale Di Maio, Oreste Iocca, Camila Lopes Cardoso, 2026-01-07 The management of oral cancer is a complex task often requiring a multidisciplinary effort. To date, advancements in early diagnosis, tailored therapies, and post-treatment care have been achieved through collaboration between surgeons, radiotherapists, oncologists, pathologists, and other specialists. Dentists also play a pivotal role in early diagnosis and post-operative rehabilitation, while speech pathologists are often vital for improving quality of life after treatment. Nutrition specialists are fundamental before, during, and after treatment. New frontiers of research in this field have developed new diagnostic and prognostic tools, less invasive ablative and reconstructive surgery, and better tailored systemic treatments. Nonetheless, significant gaps remain in uniform diagnostic standards, optimal treatment modalities tailored to individual patient profiles, and effective rehabilitation measures that optimize long-term quality of life. The scope of this Research Topic is to publish high-quality papers, either clinical research, systematic reviews, and meta-analyses, covering but not limited to the following topics:

- 1 Diagnostic methods to detect or to better identify oral potentially malignant disorders at high risk of transformation into cancer, including molecular genetic and clinical analysis.
- 2 Optimal ways to diagnose and follow up oral cavity cancer through radiology and the potential applications of radiomics.
- 3 Surgical aspects of oral cavity cancer management, including novel ablative and reconstructive techniques.
- 4 The importance of novel prognostic tools, such as lymph node yield and lymph node ratio, tumor-infiltrating lymphocytes, and tumor stromal ratio.
- 5 The role of systemic treatments in improving the survival in specific subsets of oral cancer patients. For example, the emerging role of immunotherapy in the adjuvant or neoadjuvant setting.
- 6 The importance of dental care, nutritional support, and speech rehabilitation in the perioperative setting for patients affected by oral cancer.
- 7 The management of treatment complications, such as mucositis, xerostomia, or osteoradionecrosis.
