**Exploration for Embedded Processors with LISA** Andreas Hoffmann,Heinrich Meyr,Rainer Leupers,2013-06-29 Already today more than 90% of all programmable processors are employed in embedded systems This number is actually not surprising contemplating that in a typical home you might find one or two PCs equipped with high of embedded systems performance standard processors but probably dozens including electronic entertainment household and telecom devices each of them equipped with one or more embedded processors Moreover the elec tronic components of upper class cars incorporate easily over one hundred pro cessors Hence efficient embedded processor design is certainly an area worth looking at The question arises why programmable processors are so popular in embed ded system design The answer lies in the fact that they help to narrow the gap between chip capacity and designer productivity Embedded processors cores are nothing but one step further towards improved design reuse just along the lines of standard cells in logic synthesis and macrocells in RTL synthesis in earlier times of IC design Additionally programmable processors permit to migrate functionality from hardware to software resulting in an even improved reuse factor as well as greatly increased flexibility

C. Diniz,2011-04-02 The extreme exibility of recon gurable architectures and their performance pot tial have made them a vehicle of choice in a wide range of computing domains from rapid circuit prototyping to high performance computing The increasing availability of transistors on a die has allowed the emergence of recon gurable architectures with a large number of computing resources and interconnection topologies To ploit the potential of these recon gurable architectures

programmers are forced to map their applications typically written in high level imperative programming l guages such as C or MATLAB to hardware oriented languages such as VHDL or Verilog In this process they must assume the role of hardware designers and software programmers and navigate a maze of program transformations mapping and synthesis steps to produce ef cient recon gurable computing implementations The richness and sophistication of any of these application mapping steps make the mapping of computations to these architectures an increasingly daunting process It is thus widely believed that automatic compilation from high level programming languages is the key to the success of recon gurable computing This book describes a wide range of code transformations and mapping te niques for programs described in high level programming languages most tably imperative languages to recon gurable architectures     *Thomas Register* ,2004
