**Interfacing Humans and Robots for Gait Assistance and Rehabilitation** Carlos A. Cifuentes, Marcella Múnera, 2021-09-16 The concepts represented in this textbook are explored for the first time in assistive and rehabilitation robotics which is the combination of physical cognitive and social human robot interaction to empower gait rehabilitation and assist human mobility. The aim is to consolidate the methodologies, modules and technologies implemented in lower limb exoskeletons, smart walkers and social robots when human gait assistance and rehabilitation are the primary targets. This book presents the combination of emergent technologies in healthcare applications and robotics science such as soft robotics, force control, novel sensing methods, brain-computer interfaces, serious games, automatic learning and motion planning. From the clinical perspective, case studies are presented for testing and evaluating how those robots interact with humans, analyzing acceptance, perception, biomechanics factors and physiological mechanisms of recovery during the robotic assistance or therapy. *Interfacing Humans and Robots for Gait Assistance and Rehabilitation* will enable undergraduate and graduate students of biomedical engineering, rehabilitation engineering, robotics and health sciences to understand the clinical needs, technology and science of human-robot interaction behind robotic devices for rehabilitation and the evidence and implications related to the implementation of those devices in actual therapy and daily life applications.
