Morphometrics With R Morphometrics With R:

Morphometrics with R Julien Claude, 2008-12-15 This book aims to explain how to use R to perform morphometrics. Morphometric analysis is the study of shape and size variations and covariations and their covariations with other variables. Morphometrics is thus deeply rooted within statistical sciences. While most applications concern biology, morphometrics is becoming common tools used in archeological, palaeontological, geographical or medicine disciplines. Since the recent formalizations of some of the ideas of predecessors such as D'Arcy Thompson and thanks to the development of computer technologies and new ways for appraising shape changes and variation, morphometrics have undergone and are still undergoing a revolution. Most techniques dealing with statistical shape analysis have been developed in the last three decades and the number of publications using morphometrics is increasing rapidly. However, the majority of these methods cannot be implemented in available software and therefore prospective students often need to acquire detailed knowledge in informatics and statistics before applying them to their data. With acceleration in the accumulation of methods accompanying the emerging science of statistical shape analysis, it is becoming important to use tools that allow some autonomy. R easily helps fulfill this need. R is a language and environment for statistical computing and graphics. Although there is an increasing number of computer applications that perform morphometrics using R, has several advantages that confer to users considerable power and possible new horizons in a world that requires rapid adaptability.

Habgood, 2003 This study investigates the origin of anatomically modern *Homo sapiens* throughout the Old World. The results from multivariate analyses of cranial and mandibular metric and non-metric data and morphological studies are used to investigate when anatomically modern humans first appeared in sub-Saharan Africa, north Africa, western Asia, Europe, Australasia and east Asia to ascertain what model best explains the world-wide appearance of anatomically modern *Homo sapiens*. It is found that the morphological, archaeological and genetic data provides a complex image of the transition that necessitates an

explanation combining some local continuity some population replacement and significant multidirectional gene flow This complex phenomenon can best be described as an Assimilation and Replacement model where Europe saw the replacement of the Neanderthals by anatomically modern *Homo sapiens* whereas eastern Asia experienced the assimilation of anatomically modern humans and the archaic indigenous populations
