Christoph Schmidt, 2015-12-17 This book explores how agile development practices in particular pair programming code review and automated testing help software development teams to perform better Agile software engineering has become the standard software development paradigm over the last decade and the insights provided here are taken from a large scale

survey of 80 professional software development teams working at SAP SE in Germany. In addition, the book introduces a novel measurement tool for assessing the performance of software development teams. No previous study has researched this topic with a similar data set comprising insights from more than 450 professional software engineers. *Supporting the Understanding of Team Dynamics in Agile Software Development Through Computer-Aided Sprint Feedback* Fabian Kortum, 2022-03-15. While modern project management systems support teams during planning and development activities primarily through performance-related process information, the equally relevant human factors are often insufficiently considered for explaining team dynamics, e.g., the effect of moods in teams. However, understanding team behavioral patterns are crucial for the accurate planning and steady execution of development tasks throughout an ongoing project. A computer-aided feedback concept is described, unifying interdisciplinary foundations and methods from the software engineering, data science, organizational, and social psychology fields for disclosing team dynamics in agile software projects. The concept covers the systematic capture of sociotechnical data combined with descriptive, predictive, and exploratory model-based methods that support understanding behavioural changes during the development process. Design science from information systems research is used in academic and industrial case studies to conceptualize and operationalize the feedback methods into a practical Jira plugin. A concluding evaluation through an action research method in two industrial software projects results in quantitative and qualitative findings regarding the feedback utilization and utility during agile development processes, e.g., team communication changes related to accomplished performances. The case studies underscore the practical relevance for systematic feedback and the need to better understand human factors in software projects.
