**Parallel simulation** involves the execution of a *single* simulation program on a collection of *tightly* coupled processors (e.g., a shared memory multiprocessor).

**Replicated trials** involves the execution of *several*, independent simulations concurrently on different processors

**Distributed simulation** involves the execution of a *single* simulation program on a collection of *loosely* coupled processors (e.g., PCs interconnected by a LAN or WAN).

## Parallel And Distributed Simulation Systems:

**Parallel and Distributed Simulation Systems** Richard M. Fujimoto,2000-01-03 From the preface page xv My goal in writing Parallel and Distributed Simulation Systems is to give an in depth treatment of technical issues concerning the execution of discrete event simulation programs on computing platforms composed of many processores interconnected through a network

**Parallel and Distributed Discrete Event Simulation** Carl Tropper,2002 Discrete event simulation has long been an integral part of the design process of complex engineering systems and the modelling of natural phenomena Many of the systems that we seek to understand or control can be modelled as digital systems In a digital model we view the system at discrete instants of time in effect taking snapshots of the system at these instants For example in a computer network simulation an event can be the sending of a message from one node to another node while in a VLSI logic simulation the arrival of a signal at a gate may be viewed as an event Digital systems such as computer systems are naturally susceptible to this approach However a variety of other systems may also be modelled this way These include transportation systems such as air traffic control systems epidemiological models such as the spreading of a virus and military war gaming models This book is representative of the advances in this field

*Advances in Modeling and Simulation* Andreas Tolk, John Fowler, Guodong Shao, Enver Yücesan, 2017-08-27 This broad ranging text reference presents a fascinating review of the state of the art of modeling and simulation highlighting both the seminal work of preeminent authorities and exciting developments from promising young researchers in the field. Celebrating the 50th anniversary of the Winter Simulation Conference WSC the premier international forum for disseminating recent advances in the field of system simulation the book showcases the historical importance of this influential conference while also looking forward to a bright future for the simulation community. Topics and features examines the challenge of constructing valid and efficient models emphasizing the benefits of the process of simulation modeling discusses model calibration input model risk and approaches to validating emergent behaviors in large scale complex systems with non linear interactions reviews the evolution of simulation languages and the history of the Time Warp algorithm offers a focus on the design and analysis of simulation experiments under various goals and describes how data can be farmed to support decision making provides a comprehensive overview of Bayesian belief models for simulation based decision making and introduces a model for ranking and selection in cloud computing highlights how input model uncertainty impacts simulation optimization and proposes an approach to quantify and control the impact of input model risk surveys the applications of simulation in semiconductor manufacturing in social and behavioral modeling and in military planning and training presents data analysis on the publications from the Winter Simulation Conference offering a big data perspective on the significant impact of the conference. This informative and inspiring volume will appeal to all academics and professionals interested in computational and mathematical modeling and simulation as well as to graduate students on the path to form the next generation of WSC pioneers
