directly into an Excel Workbook. This allows a user to build a ROLAP model in PowerPivot and use pivot tables to explore the model once it is built. This allows Excel to act as a Self Service BI platform implementing professional expression languages to query the model and calculate advanced measures. PowerPivot primarily uses DAX Data Analysis Expressions as its expression language although the model can be queried via MDX in a row set expression. DAX expressions allow a user to create measures based on the data model which can summarize and aggregate millions of rows of table data in seconds. DAX expressions resolve to T-SQL queries in the Formula and Storage Engines that drive the data model abstracting the more verbose and tedious work of writing formal queries to excel like formula expressions. This updated and expanded second edition of Book provides a user friendly introduction to the subject. Taking a clear structural framework it guides the reader through the subject's core elements. A flowing writing style combines with the use of illustrations and diagrams throughout the text to ensure the reader understands even the most complex of concepts. This succinct and enlightening overview is a required reading for all those interested in the subject. We hope you find this book useful in shaping your future career.
