Thermoelectric polymer-cellulose composite aerogels

Shaobo Han, 2019-10-30 Thermoelectric materials are scrutinized as energy materials and sensing materials Indeed they convert thermal energy into electrical energy In addition those materials are actively sensitive to a temperature modification through the generation of an electric signal Organic thermoelectric OTE materials are complementary to inorganic thermoelectric materials as they possess unique properties such as solution processing ionic conductivity flexibility and softness While thin film OTE materials have been widely studied because they are easily manufactured by various coating techniques little is done in the creation of three dimensional morphologies of OTE materials which is important to develop large temperature gradients Cellulose is the most abundant biopolymer on the planet Recently the applications of cellulose are not only limited in making papers but also in electronics as the cellulose provide 3 D microstructures and mechanical strength One promising approach to make 3 D OTE bulks is using cellulose as scaffold because of their properties of relatively high mechanical strength water processability and environmentally friendly performance The aims of the thesis have been to enlarge the applications of an OTE material poly 3,4-ethylenedioxythiophene PEDOT with an approach of making 3 D aerogels composite with nanofibrillated cellulose NFC in two main areas 1 multi parameter sensors and 2 solar vapor generators In the first application we demonstrate that the new thermoelectric aerogel responds independently to pressure P temperature T and humidity RH Hence when it is submitted to the three stresses T P RH the electrical characterization of the material enables to measure the three parameters without cross talking effects Thermoelectric aerogels are foreseen as active materials in electronic skins and robotics In the second application the conducting polymer aerogels are employed as solar absorbers to convert solar energy into heat and significantly increased the water evaporation rate The IR absorption is efficient because of the free electron in the conducting polymer PEDOT nano aggregates Because of the low cost of those materials and the water stability of the crosslinked aerogels they could be of importance for water

desalination Termoelektriska material har utvärderats som energi och sensormaterial Som energimaterial har de studerats som ett sätt att transformera termisk energi till elektrisk energi och har används för kylnings och uppvärmningsapplikationer Som sensormaterial kan de känna av temperatur eller temperaturskillnader och tillhandahåller elektriska signaler Organiska termoelektriska OTE material det vill säga kolbaserade termoelektriska material är komplementära till inorganiska termoelektriska material eftersom de har unika egenskaper så som processbarhet i lösningsform jonisk ledningsform ga bärbarhet och mjukhet Tunna filmer av OTE material har vida studerats eftersom de låtta att tillverka via olika beläggningsmetoder men tredimensionella strukturer är till stor del ett outforskat område och är viktigt för att uppnå stora temperaturgradienter Cellulosa är ett billigt material som utgör den vanligaste biopolymeren på vår planet Nyligen så har applikationerna för cellulosa sträckt sig bortom papperstillverkning och används nu även inom elektronik för att fästa 3D mikrostrukturer och mekanisk styrka En lovande metod för att tillverka 3D strukturer av OTE material är genom att använda cellulosan tverkpå grund av dess relativt höga mekaniska styrka processbarhet i vattenlösningar och dess miljövänlighet Syftet med denna avhandling har varit att bredda applikationerna för OTE materialet poly(3,4-ethylenedioxythiophene) PEDOT genom att tillverka 3D aerogelkompositer med nanofibrillerad cellulosa NFC Detta har gjorts inom två områden 1 Multiparameter sensorer och 2 solar vapor generators För den första applikationen så demonstrerar vi att de nya termoelektriska aerogelerna har oberoende signaler från tryck temperatur och relativ fuktighet Det vill säga att när materialet utsätts för dessa stimuli så kan signalerna som genereras urskiljas av utan förhållning De termoelektriska aerogelerna förutses bli användbara inom områdena så som elektronisk hud och robotik För den andra applikationen används de elektriskt ledande aerogelerna för att absorbera solljus för att omvandla solenergi till värme vilket kan kallas för värmeningshastigheten hos vatten Absorptionen i IR område är effektivt eftersom de rörliga elektronerna i den ledande polymeren nanoaggregerar På grund av den låga kostnaden hos dessa material och vinstabiliteten hos korslinkade aerogeler kan dessa material tänkas användas för vattenavsaltning

Green Materials for Electronics Mihai Irimia-Vladu, Eric D. Glowacki, Niyazi S. Sariciftci, Siegfried Bauer, 2017-12-04 Combining the materials science technological and device aspects of organic bioelectronics based on green materials this is the first overview of the emerging concepts involving fabrication techniques for sustainable electronics with low energy and material consumption With contributions from top notch editors and authors in one focus the book covers a collection of natural materials suited for electronics applications such as paper silk melanin DNA and nucleobases resins gums saccharides cellulose gelatine and peptides In another thrust the book focuses on device fabrication based on these materials including processing aspects and applications such as sensors signal transducers transient implantable and digestible electronics With its interdisciplinary approach this text will appeal to the chemistry physics materials science and engineering communities

Method of Forming an Electrically Conductive Cellulose Composite, 2011 An electrically conductive cellulose composite includes a cellulose matrix and an electrically conductive

carbonaceous material incorporated into the cellulose matrix The electrical conductivity of the cellulose composite is at least 10 $\mu\text{S cm}$ at 25 degree C The composite can be made by incorporating the electrically conductive carbonaceous material into a culture medium with a cellulose producing organism such as *Gluconoacetobacter hansenii* The composites can be used to form electrodes such as for use in membrane electrode assemblies for fuel cells
