the moult strategies and moult sequences of European passerines and discusses the ecological consequences of moult. Throughout the book the authors draw on the enormous amount of data on moult collected by them over 15 years of study which combined with data from the literature allow them to present a new synthesis of the subject. The second part of the book is of particular value to ringers. Following a general introduction to ageing detailed moult profiles are given for 58 species of European passerines representing all the major moult strategies backed up with useful summary statistics, schematic diagrams of the extent of moult and indications of the variation within each species. For the first time the extent of partial and suspended moult is presented in detail. The crowning feature of this book is the 480 plus full colour photographs of extended wings which show the entire range of moult patterns and of plumage ageing criteria. An appendix gives supplementary information on ageing birds by the degree of pneumatization of the skull.

*The Biology of Moult in Birds*  
Lukas Jenni, Raffael Winkler, 2020-09-22

The first comprehensive review of all aspects of the biology of moult drawing information from across the literature and in all birds from penguins to passerines. Feathers are amazing structures. All birds need to renew their feathers periodically in a process called moult. Because feathers can only be renewed as a whole all functions of the plumage are impaired during moult and so this process has a crucial impact on most aspects of a bird's life. Therefore the period of moult is one of the most important recurring annual events in the life of a bird together with reproduction and for many migration. Given the major impacts of this process on birds moult remains a sorely neglected field of ornithological research. This book written by the internationally renowned ornithologists Lukas Jenni and Raffael Winkler seeks to redress this. Early chapters provide an overview of the functions of plumage. Later it moves on to subjects such as plumage maintenance and feather wear, the two main functions of moult, feather growth, the physiology, energetics and control of moult and how moult affects plumage quality, structural quality and coloration and the consequences of this for the bird. The book concludes with a review of the various solutions developed by birds to fit moult into their annual cycle.

Complementary to the magnificent *Moult and Ageing in European Passerines* by the same authors and packed with color photography throughout, *The Biology of Moult in Birds* is the first comprehensive review of all aspects of the biology of moult drawing information from across the literature and in all birds from penguins to passerines.
