

Study Guide Covering Work

1. Definition of Work

- Work is done when a force causes an object to move a certain distance. It's about the transfer of energy that occurs due to that force.
- **Key Components:**
 - **Force:** A push or pull on an object (measured in Newtons).
 - **Displacement:** The distance an object moves in the direction of the force (measured in meters).
- **Important Note:** If the object doesn't move, or if the force is perpendicular to the direction of motion, no work is done (even if it feels like you're exerting effort!).

2. Formula for Work

- **Work (W) = Force (F) x Displacement (d) x $\cos(\theta)$**
 - θ (theta): The angle between the force and the direction of displacement.
- Units: Work is measured in **Joules (J)**. One joule is equal to one Newton-meter (N·m).

3. Types of Work

- **Positive Work:** When the force and displacement are in the same direction (e.g., pushing a box across the floor).
- **Negative Work:** When the force and displacement are in opposite directions (e.g., friction acting on a sliding object).
- **Zero Work:** When the force and displacement are perpendicular (e.g., carrying a book horizontally).

4. Examples of Work

- **Lifting a weight:** You do positive work against gravity.
- **Pushing a shopping cart:** You do positive work to overcome friction.
- **A ball rolling down a hill:** Gravity does positive work on the ball.
- **Catching a ball:** You do negative work to stop the ball's motion.

5. Work and Energy

- **Work-Energy Theorem:** The work done on an object is equal to the change in its kinetic energy (energy of motion).
