Mechanical System Dynamics Lecture Notes In Applied And Computational Mechanics:

Mechanical System Dynamics Friedrich Pfeiffer, 2008-09-27 Mechanics as a fundamental science in Physics and in Engineering deals with interactions of forces resulting in motion and deformation of material bodies Similar to other sciences Mechanics serves in the world of Physics and in that of Engineering in a different way in spite of many and increasing interdependencies Machines and mechanisms are for physicists tools for cognition and research for engineers they are the objectives of research according to a famous statement of the Frankfurt physicist and biologist Friedrich Dessauer Physicists apply machines to support their questions to Nature with the goal of new insights into our physical world Engineers apply physical knowledge to support the realization process of their ideas and their intuition Physics is an analytical Science searching for answers to questions concerning the world around us Engineering is a synthetic Science where the physical and mathematical fundamentals play the role of a kind of reinsurance with respect to a really functioning and efficiently operating machine Engineering is also an iterative Science resulting in typical long time evolutions of their products but also in terms of the relatively short time developments of improving an existing product or in developing a new one Every physical or mathematical Science has to face these properties by developing on their side new methods new practice proved algorithms up to new fundamentals adaptable to new technological developments This is as a matter of fact also true for the field of Mechanics

Optimization of Dynamical Systems with Impulse Controls and Shocks Boris Miller, Evgeny Rubinovich, 2024-09-19 This text explores the state of the art in the rapidly developing theory of impulse control and introduces the theory of singular space time transformations a new method for studying shock mechanical systems Two approaches in the theory of impulse control are presented The first more traditional approach defines the impulsive action as a discontinuity of phase coordinates depending on the current time the state preceding the action and its magnitude The second requires the use of modern methods for describing dynamical systems differential equations with measures The impulse is treated as an idealization of a very short action of high magnitude which produces an almost abrupt change of phase coordinates The relation between these two approaches is also discussed and several applications both traditional and emerging are considered This text is intended for graduate students and researchers in control engineering and optimal control theory for dynamical systems Readers are assumed to be familiar with the theory of ODEs optimal control and functional analysis though an appendix is included that covers many of the necessary mathematical concepts

Dynamics and Bifurcations of Non-Smooth Mechanical Systems Remco Leine, Henk Nijmeijer, 2006-06-13 This monograph combines the knowledge of both the field of nonlinear dynamics and non smooth mechanics presenting a framework for a class of non smooth mechanical systems using techniques from both fields The book reviews recent developments and opens the field to the nonlinear dynamics community This book addresses researchers and graduate students in engineering and mathematics interested in the modelling simulation and dynamics of non smooth systems and nonlinear dynamics

Contact Force

Models for Multibody Dynamics Paulo Flores, Hamid M. Lankarani, 2016-03-15 This book analyzes several compliant contact force models within the context of multibody dynamics while also revisiting the main issues associated with fundamental contact mechanics. In particular, it presents various contact force models from linear to nonlinear, from purely elastic to dissipative, and describes their parameters. Addressing the different numerical methods and algorithms for contact problems in multibody systems, the book describes the gross motion of multibody systems by using a two-dimensional formulation based on the absolute coordinates and employs different contact models to represent contact impact events. Results for selected planar multibody mechanical systems are presented and utilized to discuss the main assumptions and procedures adopted throughout this work. The material provided here indicates that the prediction of the dynamic behavior of mechanical systems involving contact impact strongly depends on the choice of contact force model. In short, the book provides a comprehensive resource for the multibody dynamics community and beyond on modeling contact forces and the dynamics of mechanical systems undergoing contact impact events.

New Trends in Mechanism and Machine Science Philippe Wenger, Paulo Flores, 2016-09-03 This book collects the most recent advances in mechanism science and machine theory with application to engineering. It contains selected peer-reviewed papers of the sixth International Conference on Mechanism Science held in Nantes, France, 20-23 September 2016, covering topics on mechanism design and synthesis, mechanics of robots, mechanism analysis, parallel manipulators, tensegrity mechanisms, cable mechanisms, control issues in mechanical systems, history of mechanisms, mechanisms for biomechanics and surgery, and industrial and nonindustrial applications.

Convective Heat and Mass Transfer in Rotating Disk Systems Igor V. Shevchuk, 2009-12-01 The book is devoted to investigation of a series of problems of convective heat and mass transfer in rotating disk systems. Such systems are widespread in scientific and engineering applications. As examples from the practical area, one can mention gas turbine and computer engineering disk brakes of automobiles, rotating disk air cleaners, systems of microclimate extractors, dispensers of liquids, evaporators, circular saws, medical equipment, food process engineering, etc. Among the scientific applications, it is necessary to point out rotating disk electrodes used for experimental determination of the diffusion coefficient in electrolytes. The system consisting of a fixed disk and a rotating cone that touches the disk by its vertex is widely used for measurement of the viscosity coefficient of liquids. For time being, large volume of experimental and computational data on parameters of fluid flow, heat and mass transfer in different types of rotating disk systems have been accumulated, and different theoretical approaches to their simulation have been developed. This obviously causes a need of systematization and generalization of these data in a book form.

Dynamics and Bifurcations of Non-Smooth Mechanical Systems Remco Leine, Henk Nijmeijer, 2014-03-12 This monograph combines the knowledge of both the field of nonlinear dynamics and non-smooth mechanics, presenting a framework for a class of non-smooth mechanical systems using techniques from both fields. The book reviews recent developments and opens the field to the nonlinear dynamics community. This book addresses

researchers and graduate students in engineering and mathematics interested in the modelling simulation and dynamics of non smooth systems and nonlinear dynamics

Mobile Robot: Motion Control and Path Planning Ahmad Taher Azar, Ibraheem Kasim Ibraheem, Amjad Jaleel Humaidi, 2023-06-30 This book presents the recent research advances in linear and nonlinear control techniques From both a theoretical and practical standpoint motion planning and related control challenges are key parts of robotics Indeed the literature on the planning of geometric paths and the generation of time based trajectories while accounting for the compatibility of such paths and trajectories with the kinematic and dynamic constraints of a manipulator or a mobile vehicle is extensive and rich in historical references Path planning is vital and critical for many different types of robotics including autonomous vehicles multiple robots and robot arms In the case of multiple robot route planning it is critical to produce a safe path that avoids colliding with objects or other robots When designing a safe path for an aerial or underwater robot the 3D environment must be considered As the number of degrees of freedom on a robot arm increases so does the difficulty of path planning As a result safe pathways for high dimensional systems must be developed in a timely manner Nonetheless modern robotic applications particularly those requiring one or more robots to operate in a dynamic environment e g human robot collaboration and physical interaction surveillance or exploration of unknown spaces with mobile agents etc pose new and exciting challenges to researchers and practitioners For instance planning a robot's motion in a dynamic environment necessitates the real time and online execution of difficult computational operations The development of efficient solutions for such real time computations which could be offered by specially designed computational architectures optimized algorithms and other unique contributions is thus a critical step in the advancement of present and future oriented robotics

Uncertainty Assessment of Large Finite Element Systems Christian A. Schenk, Gerhart I. Schuëller, 2005-06-08 The treatment of uncertainties in the analysis of engineering structures remains one of the premium challenges in modern structural mechanics It is only in recent years that the developments in stochastic and deterministic computational mechanics began to be synchronized To foster these developments novel computational procedures for the uncertainty assessment of large finite element systems are presented in this monograph The stochastic input is modeled by the so called Karhunen Lo ve expansion which is formulated in this context both for scalar and vector stochastic processes as well as for random fields Particularly for strongly non linear structures and systems the direct Monte Carlo simulation technique has proven to be most advantageous as method of solution The capabilities of the developed procedures are demonstrated by showing some practical applications

Static and Dynamic Coupled Fields in Bodies with Piezoeffects or Polarization Gradient Jerzy Nowacki, 2006-03-20 This book is devoted to the theory of coupled electro magneto thermo elastic fields excited in different bodies by various sources both static and dynamic It presents the classical piezoelectric and piezomagnetic effects the Mindlin's electroelastic coupling due to a polarization gradient and different combinations of these effects with thermoelasticity

Micromechanics of Contact and Interphase Layers S.

Stupkiewicz,2007-04-16 Micromechanics provides a link between the structure and the properties at different scales of observation This book deals with micromechanical analysis of interfaces and interface layers and presents several modelling tools ranging from the rigorous method of asymptotic expansions to practical finite element simulations suitable for this class of problems Two application areas are discussed Boundary layers associated with contact of rough bodies are modelled by applying a scale transition approach in which a macroscopic interface of zero thickness is seen at the micro scale as a layer with some finite thickness Secondly evolution of laminated microstructures accompanying stress induced martensitic transformations in shape memory alloys SMA is analyzed as an illustration of the case when the local interfacial phenomena here the propagation of phase transformation fronts govern the macroscopic behaviour of a heterogeneous material The corresponding two parts of the book are self contained so they can be read separately by those interested only in micromechanical modelling of contact phenomena or in modelling of pseudoelasticity and stress induced martensitic microstructures in SMA single crystals

Advances in Extended and Multifield Theories for Continua

Bernd Markert,2011-07-15 Modern computational techniques such as the Finite Element Method have since their development several decades ago successfully exploited continuum theories for numerous applications in science and technology Although standard continuum methods based upon the Cauchy Boltzmann continuum are still of great importance and are widely used it increasingly appears that material properties stemming from microstructural phenomena have to be considered This is particularly true for inhomogeneous load and deformation states where lower scale size effects begin to affect the macroscopic material response something standard continuum theories fail to account for Following this idea it is evident that standard continuum mechanics has to be augmented to capture lower scale structural and compositional phenomena and to make this information accessible to macroscopic numerical simulations

Stability and Convergence of Mechanical Systems with Unilateral Constraints Remco I. Leine,Nathan van de Wouw,2007-12-29 Stability of motion is a central theme in the dynamics of mechanical systems While the stability theory for systems with bilateral constraints is a well established field this monograph represents a systematic study of mechanical systems with unilateral constraints such as unilateral contact impact and friction Such unilateral constraints give rise to non smooth dynamical models for which stability theory is developed in this work The book starts with the treatise of the mathematical background on non smooth analysis measure and integration theory and an introduction to the field of non smooth dynamical systems The unilateral constraints are modelled in the framework of set valued force laws developed in the field of non smooth mechanics The embedding of these constitutive models in the dynamics of mechanical systems gives rises to dynamical models with impulsive phenomena This book uses the mathematical framework of measure differential inclusions to formalise such models The book proceeds with the presentation of stability results for measure differential inclusions These stability results are then applied to nonlinear mechanical systems with unilateral constraints The book closes with the study of the
