Using GPU-based Computing to Accelerate Finite Element Problems Jacob Watt, 2012 Historically Graphics Processing Units GPU have been used for offloading graphical visualization and made popular in use for video games but with the development of NVIDIA's CUDA architecture and programming language there has been an increase in the use of GPUs in general purpose GPGPU programming Problems involving large systems of linear equations such as the Finite Element Analysis FEA can benefit greatly from the parallel computing capabilities of GPUs In my thesis I will solve Poisson's equation and discuss the advantages and disadvantages of the massively parallel environment of GPUs I will show that on a unstructured grid that the matrix vector multiplication can be run 15-4 times faster on the GPU when compared to an Intel i5 CPU For all cases 2 D triangular elements with linear basis functions were used When the linear algebra problem is solved using the biconjugate gradient stabilized method BiCGSTAB the method runs 14-4 faster on the GPU as compared to the serial C code And lastly solving the whole FEA including data setup element integration assembly and memory transfer times performs 11-8 faster on the NVIDIA GPU compared to the
