**Central Nervous System Diseases and Inflammation** Thomas E. Lane, Monica Carson, Conni Bergmann, Tony

Wyss-Coray, 2007-12-24 Up until approximately 20 years ago the idea that the central nervous system CNS and components of the immune system were dynamically interactive was considered impossible or at least highly unlikely as the CNS was judged an immunosuppressive environment based upon experimental evidence highlighting the survival of tissue grafts within the brain Additional evidence supporting this viewpoint included i the presence of the blood brain barrier BBB which provides a physical and physiological obstruction that is difficult for cells and mac molecules to cross ii the relative absence of MHC class I and II expression on CNS cells like astrocytes and neurons and iii lack of abundant antigen presenting cells APC which are required for the generation of an adaptive immune response However in spite of these obstacles it is now well accepted that the CNS is r tinely subject to immune surveillance under both normal as well as diseased con tions Indeed activated cells of the immune system such as T and B lymphocytes and monocyte macrophages readily infiltrate and accumulate within the CNS f lowing microbial infection injury or upon development of autoimmune responses directed toward resident antigens of the CNS

**Vaccines against RNA Viruses** Juan Carlos Saiz, 2020-12-28 RNA viruses cause animal human and zoonotic diseases that affect millions of individuals as is being exemplified by the devastating ongoing epidemic of the recently identified SARS Cov 2 For years vaccines have had an enormous impact on overcoming the global burden of diseases Nowadays a vast number of different approaches from purified inactivated and live attenuated viruses nucleic acid DNA or RNA based candidates virus like particles subunit elements and recombinant viruses are been employed to combat viruses However for many of them efficient vaccines are not yet available This will probably change dramatically with the current Covid 19 pandemic as a vast variety of vaccinology approaches are being tested against it with hundreds of candidates under development dozens of them already in clinical trials a fact that is breaking records in vaccine development and implementation This is becoming possible thanks to the enormous work carried out during years to have the bases for a quick response even against unknown pathogens in an impressive short time Here results obtained with different vaccine s methodological approaches against human HIV HCV HRV animal PRRSV PEDV FMDV VHSV and zoonotic RVF WNV RNA viruses are presented by field experts

**Equine Viruses** Romain Paillot, 2020-04-30 The Food and Agriculture Organization of the United Nations has recently estimated that the world equid population exceeds 110 million Working equids horses ponies donkeys and mules remain essential to ensure the livelihood of poor communities around the world In many developed countries the equine industry has significant economical weight with around 7 million horses in Europe alone The close relationship between humans and equids and the fact that the athlete horse is the terrestrial mammal that travels the most worldwide after humans are important elements to consider in the transmission of pathogens and diseases amongst equids

and to other species The potential effect of climate change on vector ecology and vector borne diseases is also of concern for both human and animal health In this Special Issue we intend to explore our understanding of a panel of equine viruses looking at their pathogenicity their importance in terms of welfare and potential association with diseases their economic importance and impact on performance and how their identification can be helped by new technologies and methods
