**Metric Learning** Aurelien Bellet,Amaury Habrard,Marc Sebban,2015-01-01 Similarity between objects plays an important role in both human cognitive processes and artificial systems for recognition and categorization How to appropriately measure such similarities for a given task is crucial to the performance of many machine learning pattern recognition and data mining methods This book is devoted to metric learning a set of techniques to automatically learn similarity and distance functions from data that has attracted a lot of interest in machine learning and related fields in the past ten years In this book we provide a thorough review of the metric learning literature that covers algorithms theory and applications for both numerical and structured data We first introduce relevant definitions and classic metric functions as well as examples of their use in machine learning and data mining We then review a wide range of metric learning algorithms starting with the simple setting of linear distance and similarity learning We show how one may scale up these methods to very large amounts of training data To go beyond the linear case we discuss methods that learn nonlinear metrics or multiple linear metrics throughout the feature space and review methods for more complex settings such as multi task and semi supervised learning Although most of the existing work has focused on numerical data we cover the literature on metric learning for structured data like strings trees graphs and time series In the more technical part of the book we present some recent statistical frameworks for analyzing the generalization performance in metric learning and derive results for some of the algorithms presented earlier Finally we illustrate the relevance of metric learning in real world problems through a series of successful applications to computer vision bioinformatics and information retrieval

### **Visual Domain Adaptation in the Deep Learning Era** Gabriela Csurka, Timothy M.

Hospedales, Mathieu Salzmann, Tatiana Tommasi, 2022-04-05 Solving problems with deep neural networks typically relies on massive amounts of labeled training data to achieve high performance b While in many situations huge volumes of unlabeled data can be and often are generated and available the cost of acquiring data labels remains high Transfer learning TL and in particular domain adaptation DA has emerged as an effective solution to overcome the burden of annotation exploiting the unlabeled data available from the target domain together with labeled data or pre trained models from similar yet different source domains The aim of this book is to provide an overview of such DA TL methods applied to computer vision a field whose popularity has increased significantly in the last few years We set the stage by revisiting the theoretical background and some of the historical shallow methods before discussing and comparing different domain adaptation strategies that exploit deep architectures for visual recognition We introduce the space of self training based methods that draw inspiration from the related fields of deep semi supervised and self supervised learning in solving the deep domain adaptation Going beyond the classic domain adaptation problem we then explore the rich space of problem settings that arise when applying domain adaptation in practice such as partial or open set DA where source and target data categories do not fully overlap continuous DA where the target data comes as a stream and so on We next consider the least restrictive setting of domain generalization DG as an extreme case where neither labeled nor unlabeled target data are available during training Finally we close by considering the emerging area of learning to learn and how it can be applied to further improve existing approaches to cross domain learning problems such as DA and DG
