Adeno-Associated Virus (AAV) Vectors in Gene Therapy Kenneth I. Berns,Catherine Giraud,1996-08-01 Human gene therapy holds great promise for the cure of many genetic diseases In order to achieve such a cure there are two requirements First the affected gene must be cloned its se quence determined and its regulation adequately characterized Second a suitable vector for the delivery of a good copy of the affected gene must be available For a vector to be of use

several attributes are highly desirable these include ability to carry the intact gene although this may be either the genomic or the cDNA form in a stable form ability to introduce the gene into the desired cell type ability to express the introduced gene in an appropriately regulated manner for an extended period of time and a lack of toxicity for the recipient Also of concern is the frequency of cell transformation and in some cases the ability to introduce the gene into nondividing stem cells Several animal viruses have been tested as potential vectors but none has proven to have all the desired properties described above For example retroviruses are difficult to propagate in sufficient titers do not integrate into nondividing cells and are of concern because of their oncogenic properties in some hosts and because they integrate at many sites in the genome and thus are potentially insertional mutagens Additionally genes introduced by retroviral vectors are frequently expressed for relatively short periods of time A second virus used as a vector in model systems has been adenovirus Ad
