**Metabolic Reprogramming Induced by Ketone Bodies Diminishes Pancreatic Cancer Cachexia** Manchester Manchester Press, 2015-12-15 This open access article by various authors presents key research on Metabolic reprogramming induced by ketone bodies diminishes pancreatic cancer cachexia Aberrant energy metabolism is a hallmark of cancer To fulfill the increased energy requirements tumor cells secrete cytokines factors inducing muscle and fat degradation in cancer patients a condition known as cancer cachexia It accounts for nearly 20% of all cancer related deaths However the mechanistic basis of cancer cachexia and therapies targeting cancer cachexia thus far remain elusive A ketogenic diet a high fat and low carbohydrate diet that elevates circulating levels of ketone bodies i e acetoacetate beta hydroxybutyrate and acetone serves as an alternative energy source It has also been proposed that a ketogenic diet leads to systemic metabolic changes Keeping in view the significant role of metabolic alterations in cancer we hypothesized that a ketogenic diet may diminish glycolytic flux in tumor cells to alleviate cachexia syndrome and hence may provide an efficient therapeutic strategy

[Experimental Biology and Medicine](#) ,2003    [Nutrition Abstracts and Reviews](#) ,2003    **Molecular Mechanisms of Metabolic Reprogramming in Pancreatic Cancer** Sonam Kumari,2019 Pancreatic cancer ranks as third deadliest cancer worldwide in both men and women The lack of diagnostic methods chemo resistance and invasiveness of the disease diminishes the overall survival rate in patients Dysregulated glucose metabolism and several molecular determinants including oncogenic signaling pathways play pivotal roles in the development progression and metastasis of pancreatic cancer The aberrant glucose metabolism is the most prevalent key factor that influences pancreatic tumorigenesis The cancer cells of pancreas utilize oxygen for the breakdown of glucose to lactate which is known as Warburg effect This phenotype of pancreatic cancer encourages proliferation growth migration and invasive phenotypes of cancer cells that worsens the disease The upstream regulatory molecules responsible for deviant activity of glucose transporters during

aberrant glucose metabolism was not very well defined. Thus identification of new molecular determinants that regulate glucose metabolic pathway would provide promising therapeutic outcomes. Our lab has established the role of MUC13 protein in pancreatic cancer development. Another interesting molecule Protein Kinase D1 has been reported to play essential role in hypoxic metabolism in squamous cell carcinoma and glucose uptake in cardiac hypertrophy. Also it has been extensively studied in our research group and has been suggested by some other groups to have an essential role in pancreatic cancer. However its role in regulating glucose metabolism in pancreatic cancer remains elusive. In this dissertation we investigated that MUC13 and PKD1 proteins are involved in abrupt glucose metabolism in pancreatic cancer cells. We have demonstrated that targeted overexpression of these oncogenes upregulates key oncogenic signaling components involved in aberrant glucose metabolism in pancreatic cancer cells. We also investigated a natural agent Steviol that restored glucose metabolism in pancreatic cancer cells via repression of MUC13 and PKD1 expression. MUC13 is a transmembrane glycoprotein which has an elevated expression in pancreatic cancer. Due to the presence of a cytoplasmic domain it confers kinase activity and regulates many signaling processes. Therefore we investigated the effect of MUC13 in metabolic reconditioning of pancreatic cancer. As a result it was observed that presence of MUC13 in pancreatic cancer upregulated glucose uptake and lactate secretion. This in turn led to more aggressive behavior of the tumor as evidenced by enhanced proliferation, migration and invasive characteristics of the cells as compared to MUC13 null cells. Interestingly we observed the interaction of MUC13 with Glut 1 protein which influences glucose uptake in cancer cells. This was confirmed through various assays such as immunoprecipitation, immunofluorescence, co-capping and proximity ligation assay. The interpretation of inhibitor results envisaged the role of NF kappa B pathway during the molecular interactions of MUC13 and Glut 1. To understand the clinical importance of this mechanism we evaluated this interaction in tumor samples from the patients with pancreatic disease in advanced stages. Our findings fortified the mechanistic role of MUC13 in rewiring of aberrant glucose metabolism. Altogether we believed that MUC13 has clinical implication as a key molecule that might be responsible for dysregulated glucose metabolism. As discussed earlier about the paucity of associated proteins related to dysregulated glucose metabolism we further investigated the possible key players with kinase domain for association and activation with other signaling molecules. Protein Kinase D1 (PKD1) a Ser/Thr kinase has been shown to be involved in progression of pancreatic cancer. In this study we established PKD1 as a novel molecular target and its involvement in regulating aberrant glucose metabolism in pancreatic cancer. We observed that PKD1 was overexpressed in pancreatic cancer tissues compared to normal human tissues. We also found constitutive expression of PKD1 in various pancreatic cancer cells as compared to normal pancreatic ductal epithelial cells. The overexpression of PKD1 in low PKD1 expressing pancreatic cancer cells enhanced tumorigenic characteristics. We observed that specific knockdown of PKD1 inhibited key oncogenic signaling components in pancreatic cancer cells suggesting its oncogenic role in pancreatic cancer. Additionally during the PKD1

overexpression cells displayed increased glucose consumption and lactate production. This suggested role of PKD1 in metabolic reprogramming in pancreatic cancer. Also we observed that PKD1 stimulates the glucose uptake through mTORC1, a component of mTOR signaling pathway. Additionally the knockdown of PKD1 promoted the chemosensitivity of cells towards gemcitabine and 2DG (2 deoxyglucose). Overall these results indicated a significant function of PKD1 in rewiring of glucose metabolism in pancreatic cancer. It was mandatory to target and counteract the aberrant glucose metabolism along with the proteins identified in our previous results. In this perspective herein we proposed steviol, a natural sweetener from plant origin to assess its inhibitory action towards dysregulated glucose metabolism and its associated proteins MUC13 and PKD1. The reason behind steviol selection for this approach includes that it mimics the glucose molecule that facilitates enhanced uptake of drug steviol within the cells and on the other side it provides glucose homeostasis to adjacent normal cells. These features made steviol as dual functional drug by overtaking other natural drugs for promising results. The exposure of steviol inhibited the proliferative IC<sub>50</sub> 10mM and clonogenic abilities of pancreatic cancer cells. It also suppressed the cell migration and cell invasion capabilities of pancreatic cancer cells. Further steviol caused the selective inhibition of intracellular glucose intake and lactate accumulation in a concentration dependent manner. The selective inhibition of MUC13 and PKD1 upstream key proteins of glucose metabolism that caused the disruption of glucose intake in cancer cells was observed during steviol treatment. Secondly steviol interfered with translation initiation machinery causing destabilization of the cellular functionality. The impairment of cellular translation process had promoted G1 cell cycle arrest in cells due to the lack of G1/S transition proteins during drug exposure. Collectively all these events engendered the cellular integrity and directed towards activation of apoptosis. In conclusion we evaluated the role of MUC13 and PKD1 in aberrant glucose metabolism leading to growth and aggressive metastatic phenotypes of pancreatic cancer. We also demonstrated efficacy of steviol to repress aberrant glucose metabolism via suppression of MUC13 and PKD1 proteins.

,1984    Conference Papers Index, 1987    **Exploring Pancreatic Metabolism and Malignancy** Ganji Purnachandra Nagaraju, Aramati BM Reddy, 2019-11-23. This book comprehensively describes the association between metabolic syndrome and pancreatic cancer progression and the mechanism of action and target definition with a view to drug discovery. Metabolic syndrome which includes abdominal obesity, hypertension, dyslipidemia and hyperglycemia has recently been shown to play an important role in the etiology and progression of various cancers. Further, obesity and diabetes have been associated with an increased incidence of gastric cancers. The book reviews the key biological mechanisms underlying the association between metabolic dysregulation including obesity associated enhancement of growth factor signaling, inflammation and perturbation in pancreatic cancer cell growth and metastasis. It also illustrates the role of the inflammatory signaling pathway in metabolic diseases as well as tumor growth and explores the potential of these pathways as the rational targets for pancreatic cancer therapy. Lastly the book offers a comprehensive description of the challenges associated with diabetes.

**Metabolic Reprogramming of Pancreatic Ductal Adenocarcinoma Cells in Response to Chronic Low PH Stress** Jaime Abrego, 2017 Pancreatic ductal adenocarcinoma PDAC is among the most lethal of all cancers with a 5 year survival rate of only 8 2% This is because PDAC is diagnosed in its advanced stages and is characterized by radio and chemotherapy resistance Aggressiveness of PDAC tumors is attributed to its high metabolic phenotype which is characterized by increased glycolysis rate and lactate secretion while oxidative metabolism is reduced These metabolic features are required to fulfill the biosynthetic demands of proliferating PDAC cells However this increase in metabolic activity results in acidification of the extracellular space because the dense fibrotic stroma of PDAC tumors limits venting of protons into the vasculature thereby creating a chronic low pH microenvironment Little is known regarding the physiology and metabolism of cancer cells enduring chronic low pH exposure To demonstrate effects of low pH PDAC cells were cultured in low pH 6 9 7 0 to establish chronic low pH as it occurs in tumors These cells were compared to cells in physiological pH of 7 4 which is also the pH of cell culture in order to evaluate physiological differences between these pH values In these experiments it was observed that cells in low pH have reduced clonogenic capacity and undergo a metabolic shift to oxidative metabolism that is supported by an increase in glutamine uptake These observations exhibit a robust contrast to PDAC cells in control pH conditions that are highly glycolytic Furthermore in low pH there is increased transcription of the GOT1 enzyme which mediates metabolic flux through the non canonical glutamine metabolic pathway that allows synthesis of other metabolic substrates from glutamine Upon shRNA mediated depletion of GOT1 survival of PDAC cells in low pH was significantly impaired due to increase in ROS to cytotoxic levels However supplementing transfected clones with GOT1 metabolic product oxaloacetate resulted in growth rescue and reduction in ROS levels Thus in chronic low pH stress PDAC cells up regulate non canonical glutamine metabolism through increased transcription of GOT1 which allows PDAC cells to generate energy and metabolic co factors to suppress cytotoxic ROS levels Low pH is a universal feature of the PDAC tumor microenvironment and further dissection of metabolic adaptations to microenvironment

Pancreatic cancer PC is one of the most aggressive solid malignancies with an overall 5 year survival rate of 8% and it is predicted to become the second leading cause of cancer related death by 2030 PC progression and metastasis are strongly influenced by metabolic stress imposed by the tumor microenvironment TME due to limited oxygen and nutrient supply and unfavorable pH In this context deregulation and the reprogramming of energy metabolism are hallmarks of PC which leads tumor cells to rewire their glucose amino acid and lipid metabolism on the basis of the bioenergetic and biosynthetic demands needed to survive and escape immunosurveillance For this reason exploiting cellular plasticity through the targeted reprogramming of metabolic features in PC could lead to the generation of promising and novel selective therapeutic approaches for patients treatment     *Metabolic Derangements in Pancreatic Cancer* Franziska Romrig,2013
