## **Optical Spectroscopy Of Semiconductor Nanostructures:**

**Optical Spectroscopy of Semiconductor Nanostructures** Eugenius L. Ivchenko, 2005 This volume looks at optical spectroscopy of semiconductor nanostructures. Some of the topics it covers include quantum confinement in low dimensional systems, resonant light reflection and transmission, and absorption. **Near Field Optical Spectroscopy of Semiconductor Nanostructures** Vadim Regelman, Tekhnologiya, 2002. **Optical Properties of Semiconductor Nanostructures** Marcin L. Sadowski, Marek Potemski, Marian Grynberg, 2012-12-06. Optical methods for investigating semiconductors and the theoretical description of optical processes have always been an important part of semiconductor physics. Only the emphasis placed on different materials changes with time. Here a large number of papers are devoted to quantum dots, presenting the theory, spectroscopic investigation, and methods of producing such structures. Another major part of the book reflects the growing interest in diluted semiconductors and II-IV nanosystems in general. There are also discussions of the fascinating field of photonic crystals. Classical low-dimensional systems such as GaAs/GaAlAs quantum wells and heterostructures still make up a significant part of the results presented, and they also serve as model systems for new phenomena. New materials are being sought and new experimental techniques are coming on stream, in particular the combination of different spectroscopic modalities.

**Optical Spectroscopy of Dipole and Electron Spin Coherences in Semiconductor Nanostructures** Phedon Palinginis, 2004. **Modelling of Semiconductor Nanostructures** Boon Hon Hong, 2011. III-V semiconductor nanostructures are widely used in optoelectronic devices, e.g. lasers and detectors in the visible (0.4-0.8 μm), near infrared (0.8-3 μm), mid-infrared (3.5-8 μm) and far infrared (8-14 μm) wavelength ranges, with great potential for high performance and high-temperature operation. As well as simple designs, complex structures incorporating low-dimensional components, e.g. quantum wells and quantum dots, are not unusual. Often the optical and electronic characteristics of these structures are altered significantly as compared to bulk material. As a prerequisite to design for different applications, the study of their electronic and optical properties is essential. With the increasing computational power of modern personal computers, computational modelling becomes viable and more efficient. Indeed, it has become routine to follow or to precede experimental studies with computational modelling of good interpretive and predictive power. Combined with experimental studies, this is a powerful

tool to provide insight into new devices This research work is primarily based on calculations of the electronic band structure of various semiconductor nanostructures followed by modelling of optical transitions and optical spectra All numerical calculations use a cost effective computational method The applicability of the model to ultra thin structures of short period InAs GaSb superlattices is investigated The work is then extended to study complex quantum dot in well structures Finally the attempt to extract the structural parameters of quantum dots by a combination of modelling and optical spectroscopy is presented
