number of output variables for pressure temperature precipitation etc methods for visualising multivariate isosurfaces are needed Feature level sets offer such a method by interpreting an isosurface as the result of an intersection of the isovalue with the data in the domain From this we expand the notion of isovalues in this context called traits and isosurfaces to arbitrary dimensionality An intermediate product of the calculation of feature level sets is the distance field defining every data point s distance towards the trait Given this distance field we compute the merge tree for it and thereby enable topological analysis of multivariate data The choice of merge trees comes naturally as minima in the distance field correspond to regions closest to the trait The concept of derived fields as input is also used in our approach to topological analysis of tensor fields Special attention needs to be paid to the non linear behaviour of derived vector and scalar fields We use the field of eigenvectors derived from the tensor field to determine cells containing degenerate points in tensor fields and insert zero valued points in the corresponding anisotropy field This process yields a scalar field which can subsequently be used as input for further topological analysis Another challenge when it comes to the visualisation of tensor fields is the design of transfer functions in the context of volume rendering This is because of the high dimensional entity that is a tensor and its non linear derivatives We span a shape space which is populated by representatives which visually encode the tensor This allows the user to steer the rendering by selecting the desired shape of the tensor rather than adjusting a slider for a derived scalar value

dimensionalitet En mellanprodukt av beräkningen av feature level sets är avståndet som definierar varje datapunkts avstånd till traiten. Med tanke på detta avstånd förknäpar vi merge trees för det och möjliggör därefter genom topologisk analys av multivariata data. Valet av merge trees kommer naturligtvis till minimala avståndet motsvarar regionerna närmast traiten. Konceptet med beräknade funktioner som input används också i vår förhållningssätt till topologisk analys av tensorfält. Det är linjära betecknandet hos händelse uträknade vektor och skalär fält för händelse rättnings rättnings skild uppmärksamhet. Vi använder fältet av egenvektorer som händelse för tensorfältet för att bestämma celler som innehåller degenererade punkter i tensorfältet och infogar nollvärdepunkter i motsvarande anisotropifält. Denna process ger ett skalär fält som sedan kan användas som input för ytterligare topologisk analys. En annan utmaning när det kommer till visualisering av tensorfält är utformningen av verfringsfunktioner i samband med volymrendering. Detta beror på den högdimensionella enheten som är en tensor och dess linjära derivator. Vi erbjuder ett bredd designutrymme för att visuellt koda tensorerna. Detta gör att användaren kan styra renderingen genom att välja önskad form av tensorerna istället för att justera en skjutreglage för ett händelse skalär värde. 2 Svensk ordbok. Altenbach, Wolfgang H. Müller, Bilen Emek Abali, 2019-11-04 This book discusses recent findings and advanced theories presented at two workshops at TU Berlin in 2017 and 2018. It underlines several advantages of generalized continuum models compared to the classical Cauchy continuum which although widely used in engineering practice has a number of limitations such as The structural size is very small The microstructure is complex The effects are localized As such the development of generalized continuum models is helpful and results in a better description of the behavior of structures or materials At the same time there are more and more experimental studies supporting the new models because the number of material parameters is higher **Rundbrief der Gesellschaft für Angewandte Mathematik und Mechanik** Gesellschaft für Angewandte Mathematik und Mechanik, 2000 **AIAA Journal** American Institute of Aeronautics and Astronautics, 2007

Nonsmooth Mechanics of Solids Jaroslav Haslinger, Georgios E. Stavroulakis, 2006-11-21 Mechanics have played an important role in mathematics from infinitesimal calculus calculus of variations partial differential equations and numerical methods finite elements Originally mechanics treated smooth objects Technological progress has evoked the necessity to model and solve more complicated problems like unilateral contact and friction plasticity delamination and adhesion advanced materials etc The new tools include convex analysis differential calculus for convex functions and subgradients of convex functions and extensions for nonconvex problems Nonsmooth mechanics is a relatively complex field and requires a good knowledge of mechanics and a good background in some parts of modern mathematics The present volume of lecture notes follows a very successful advanced school with the aim to cover as much as possible all these aspects Therefore the contributions cover mechanical aspects as well as the mathematical and numerical treatment *Mathematical Reviews*
