The Design and Analysis of Potency Assays for Biotechnology Products

Fred Brown,Anthony R. Mire-Sluis,2002 The complexity of the structure and function of many biotechnology derived products necessitates a wide range of analytical procedures to adequately characterize the product Physicochemical techniques provide little if any information regarding the potency of biologicals Therefore the development and analysis of biological assays that measure the ability of a material to elicit a function are essential to successful product development Bioassays such as in vivo or cell based assays often exhibit inherent variability due to the use of living materials It is necessary to design and execute bioassays to reduce variability as much as possible whilst enabling statistically valid measures of the reproducibility of potency estimates The manuscripts in this volume aim to describe statistical approaches currently being used in the design and analysis of potency assays for biotechnology products and to identify factors influencing the appropriate choice of these approaches Issues that impact on assay design implementation validation and interpretation are discussed both from the analysts and statisticians perspective
