**Noise and Fluctuations** D. K. C. MacDonald, 2013-01-23 An understanding of fluctuations and their role is both useful and fundamental to the study of physics This concise study of random processes offers graduate students and research physicists a survey that encompasses both the relationship of Brownian Movement with statistical mechanics and the problem of irreversible processes It outlines the basics of the physics involved without the strictures of mathematical rigor The three part treatment starts with a general survey of Brownian Movement including electrical Brownian Movement and shot noise Part two explores correlation frequency spectrum and distribution function with particular focus on application to Brownian Movement The final section examines noise in electric currents including noise in vacuum tubes and a random rectangular current Frequent footnotes amplify the text along with an extensive selection of Appendixes

*Equilibrium and Non-equilibrium Statistical Mechanics* Carolyn M. Van Vliet, 2008 This book encompasses our current understanding of the ensemble approach to many body physics phase transitions and other thermal phenomena as well as the quantum

foundations of linear response theory kinetic equations and stochastic processes It is destined to be a standard text for graduate students but it will also serve the specialist researcher in this fascinating field some more elementary topics have been included in order to make the book self contained The historical methods of J Willard Gibbs and Ludwig Boltzmann applied to the quantum description rather than phase space are featured The tools for computations in the microcanonical canonical and grand canonical ensembles are carefully developed and then applied to a variety of classical and standard quantum situations After the language of second quantization has been introduced strongly interacting systems such as quantum liquids superfluids and superconductivity are treated in detail For the connoisseur there is a section on diagrammatic methods and applications In the second part dealing with non equilibrium processes the emphasis is on the quantum foundations of Markovian behaviour and irreversibility via the Pauli Van Hove master equation Justifiable linear response expressions and the quantum Boltzmann approach are discussed and applied to various condensed matter problems From this basis the Onsager Casimir relations are derived together with the mesoscopic master equation the Langevin equation and the Fokker Planck truncation procedure Brownian motion and modern stochastic problems such as fluctuations in optical signals and radiation fields briefly make the round
