Normal Forms And Homoclinic Chaos Fields Institute Communications:

Normal Forms and Homoclinic Chaos William F. Langford, 1995 This volume presents new research on normal forms symmetry homoclinic cycles and chaos from the Workshop on Normal Forms and Homoclinic Chaos held during The Fields Institute Program Year on Dynamical Systems and Bifurcation Theory in November 1992 in Waterloo Canada The workshop bridged the local and global analysis of dynamical systems with emphasis on normal forms and the recently discovered homoclinic cycles which may arise in normal forms *Bifurcations in Hamiltonian Systems* Henk Broer, Igor Hoveijn, Gert Lunter, Gert Vegter, 2003-01-01 The authors consider applications of singularity theory and computer algebra to bifurcations of Hamiltonian dynamical systems They restrict themselves to the case where the following simplification is possible Near the equilibrium or quasi periodic solution under consideration the linear part allows approximation by a normalized Hamiltonian system with a torus symmetry It is assumed that reduction by this symmetry leads to a system with one degree of freedom The volume focuses on two such reduction methods the planar reduction or polar coordinates method and the reduction by the energy momentum mapping The one degree of freedom system then is tackled by singularity theory where computer algebra in particular Gröbner basis techniques are applied The readership addressed consists of advanced graduate students and researchers in dynamical systems **Pattern Formation: Symmetry Methods and Applications** John M.

Chadam, 1996 This volume contains the proceedings of two related workshops held at The Fields Institute in February and March 1993 The workshops were an integral part of the thematic year in Dynamical Systems and Bifurcation Theory held during the 1992 1993 academic year This volume covers the full spectrum of research involved in combining symmetry methods with dynamical systems and bifurcation theory from the development of the mathematical theory in order to understand the underlying mechanisms to the application of this new mathematical theory to partial differential equation models of realistic phenomena Mathematical Sciences with Multidisciplinary Applications Bourama Toni, 2016-08-19 This book is the fourth in a multidisciplinary series which brings together leading researchers in the STEAM H disciplines Science Technology Engineering Agriculture Mathematics and Health to present their perspective on advances in their own specific fields and to generate a genuinely interdisciplinary collaboration that transcends parochial subject matter boundaries All contributions are carefully edited peer reviewed reasonably self contained and pedagogically crafted for a multidisciplinary readership Contributions are drawn from a variety of fields including mathematics statistics game theory and behavioral sciences biomathematics and physical chemistry computer science and human centered computing This volume is dedicated to Professor Christiane Rousseau whose work inspires the STEAM H series in recognition of her passion for the mathematical sciences and her ongoing initiative the Mathematics of Planet Earth paradigm of interdisciplinarity The volume's primary goal is to enhance interdisciplinary understanding between these areas of research by showing how new advances in a particular field can be relevant to open problems in another and how many disciplines contribute to a better understanding of

relevant issues at the interface of mathematics and the sciences The main emphasis is on important methods research directions and applications of analysis within and beyond each field As such the volume aims to foster student interest and participation in the STEAM H domain as well as promote interdisciplinary research collaborations The volume is valuable as a reference of choice and a source of inspiration for a broad spectrum of scientists mathematicians research students and postdoctoral fellows

The Arnoldfest Vladimir Igorevich Arnol'd,1999 This volume presents articles originating from invited talks at an exciting international conference held at The Fields Institute in Toronto celebrating the sixtieth birthday of the renowned mathematician Vladimir Arnold Experts from the world over including several from Arnold s school gave illuminating talks and lively poster sessions The presentations focused on Arnold s main areas of interest singularity theory the theory of curves symmetry groups dynamical systems mechanics and related areas of mathematics The book begins with notes of three lectures by V Arnold given in the framework of the Institute s Distinguished Lecturer program The topics of the lectures are 1 From Hilbert s Superposition Problem to Dynamical Systems 2 Symplectization Complexification and Mathematical Trinities 3 Topological Problems in Wave Propagation Theory and Topological Economy Principle in Algebraic Geometry Arnold s three articles include insightful comments on Russian and Western mathematics and science Complementing the first is Jurgen Moser s Recollections concerning some of the history of KAM theory

Advances in Nonlinear Mechanics in China Wenhui Huang,2002-01-01 Since the 1990s significant advances have been made in the research on nonlinear dynamics in China Many papers were published in Chinese in the Journal of Vibration Engineering Journal of Nonlinear Dynamics and Vibration and Shock This work offers translations of selected articles

Local and Semi-Local Bifurcations in Hamiltonian Dynamical Systems Heinz Hanßmann,2007 Once again KAM theory is committed in the context of nearly integrable Hamiltonian systems While elliptic and hyperbolic tori determine the distribution of maximal invariant tori they themselves form n parameter families Hence without the need for untypical conditions or external parameters torus bifurcations of high co dimension may be found in a single given Hamiltonian system The text moves gradually from the integrable case in which symmetries allow for reduction to bifurcating equilibria to non integrability where smooth parametrisations have to be replaced by Cantor sets Planar singularities and their versal unfoldings are an important ingredient that helps to explain the underlying dynamics in a transparent way

Handbook of Dynamical Systems Boris Hasselblatt, B. Fiedler, A. B. Katok, 2002-02-21 This handbook is volume II in a series collecting mathematical state of the art surveys in the field of dynamical systems. Much of this field has developed from interactions with other areas of science and this volume shows how concepts of dynamical systems further the understanding of mathematical issues that arise in applications. Although modeling issues are addressed, the central theme is the mathematically rigorous investigation of the resulting differential equations and their dynamic behavior. However, the authors and editors have made an effort to ensure readability on a non-technical level for mathematicians from other fields and for other scientists and engineers. The eighteen surveys collected here do not aspire to encyclopedic completeness but present selected paradigms. The surveys are grouped into those emphasizing finite dimensional methods, numerics, topological methods, and partial differential equations. Application areas include the dynamics of neural networks, fluid flows, nonlinear optics, and many others. While the survey articles can be read independently, they deeply share recurrent themes from dynamical systems: Attractors, bifurcations, center manifolds, dimension reduction, ergodicity, homoclinicity, hyperbolicity, invariant and inertial manifolds, normal forms, recurrence, shift dynamics, stability, to name just a few, are ubiquitous dynamical concepts throughout the articles.
