National Aeronautics and Space Administration Nasa,2018-10-18 An existing computer code that determines the flow path for an axial flow compressor either for a given number of stages or for a given overall pressure ratio was modified for use in air breathing engine conceptual design studies This code uses a rapid approximate design methodology that is based on isentropic simple radial equilibrium Calculations are performed at constant span fraction locations from tip to hub Energy addition per stage is controlled by specifying the maximum allowable values for several aerodynamic design parameters New modeling was introduced to the code to overcome perceived limitations Specific changes included variable rather than constant tip radius flow path inclination added to the continuity equation input of mass flow rate directly rather than indirectly as inlet axial velocity solution for the exact value of overall pressure ratio rather than for any value that met or exceeded it and internal computation of efficiency rather than the use of input values The modified code was shown to be capable of computing efficiencies that are compatible with those of five multistage compressors and one fan that were tested experimentally This report serves as a users manual for the revised code Compressor Spanline Analysis CSPAN The modeling modifications including two internal loss correlations are presented Program input and output are described A sample case for a multistage compressor is included Glassman Arthur J Unspecified Center NAG3 1165 RTOP 505 69 50
